Implementing the challenge handler in Cordova applications

Overview

Prerequisite: Make sure to read the **CredentialsValidationSecurityCheck**'s challenge handler implementation (../../credentials-validation/cordova) tutorial.

The challenge handler will demonstrate a few additional features (APIs) such as the preemptive `login`, `logout` and `obtainAccessToken`.

Login

In this example, `UserLogin` expects *key:value*s called `username` and `password`. Optionally, it also accepts a boolean `rememberMe` key that will tell the security check to remember this user for a longer period. In the sample application, this is collected using a boolean value from a checkbox in the login form.

```
userLoginChallengeHandler.submitChallengeAnswer({'username':username, 'password':password, reme
mberMe: rememberMeState});
```

You may also want to login a user without any challenge being received. For example, showing a login screen as the first screen of the application, or showing a login screen after a logout, or a login failure. We call those scenarios **preemptive logins**.

You cannot call the `submitChallengeAnswer` API if there is no challenge to answer. For those scenarios, the MobileFirst Platform Foundation SDK includes the `login` API:

```
WLAuthorizationManager.login(securityCheckName,{'username':username, 'password':password, remem
berMe: rememberMeState}).then(
    function () {
        WL.Logger.debug("login onSuccess");
    },
    function (response) {
        WL.Logger.debug("login onFailure: " + JSON.stringify(response));
    });
```

If the credentials are wrong, the security check will send back a **challenge**.

It is the developer's responsibility to know when to use `login` vs `submitChallengeAnswer` based on the application's needs. One way to achieve this is to define a boolean flag, for example `isChallenged`, and set it to `true` when reaching `handleChallenge` or set it to `false` in any other cases (failure, success, initializing, etc).

When the user clicks the **Login** button, you can dynamically choose which API to use:

```
if (isChallenged){
    userLoginChallengeHandler.submitChallengeAnswer({'username':username, 'password':password, rem
emberMe: rememberMeState});
} else {
    WLAuthorizationManager.login(securityCheckName,{'username':username, 'password':password, reme
mberMe: rememberMeState}).then(
//...
    );
}
```

> **Note:** `WLAuthorizationManager`'s `login()` API has its own `onSuccess` and `onFailure` methods, the relevant challenge handler's `processSuccess` or `handleFailure` will **also** be called.

Obtaining an access token

Since this security check supports *remember me* functionality, it would be useful to check if the client is currently logged in, during the application startup.

The MobileFirst Platform Foundation SDK provides the `obtainAccessToken` API to ask the server for a valid token:

```
WLAuthorizationManager.obtainAccessToken(userLoginChallengeHandler.securityCheckName).then(
    function (accessToken) {
        WL.Logger.debug("obtainAccessToken onSuccess");
        showProtectedDiv();
    },
    function (response) {
        WL.Logger.debug("obtainAccessToken onFailure: " + JSON.stringify(response));
        showLoginDiv();
});
```

> **Note:** `WLAuthorizationManager`'s `obtainAccessToken()` API has its own `onSuccess` and `onFailure` methods, the relevant challenge handler's `processSuccess` or `handleFailure` will **also** be called.

If the client is already logged-in or is in the *remembered* state, the API will trigger a success. If the client is not logged in, the security check will send back a challenge.

The `obtainAccessToken` API takes in a **scope**. The scope can be the name of your **security check**.

> Learn more about **scope** in the Authorization concepts (../../authorization-concepts) tutorial

Retrieving the authenticated user

The challenge handler's `processSuccess` method receives a `data` as a parameter. If the security check sets an `AuthenticatedUser`, this object will contain the user's properties. You can use `processSuccess` to save the current user:

```
userLoginChallengeHandler.processSuccess = function(data) {
    WL.Logger.debug("processSuccess");
    isChallenged = false;
    document.getElementById ("rememberMe").checked = false;
    document.getElementById('username').value = "";
    document.getElementById('password').value = "";
    document.getElementById("helloUser").innerHTML = "Hello, " + data.user.displayName;
    showProtectedDiv();
}
```

Here, `data` has a key called `user` which itself contains a `JSONObject` representing the `AuthenticatedUser`:

```
{
  "user": {
    "id": "john",
    "displayName": "john",
    "authenticatedAt": 1455803338008,
    "authenticatedBy": "UserLogin"
  }
}
```

Logout

The MobileFirst Platform Foundation SDK also provides a `logout` API to logout from a specific security check:

```
WLAuthorizationManager.logout(securityCheckName).then(
    function () {
        WL.Logger.debug("logout onSuccess");
        location.reload();
    },
    function (response) {
        WL.Logger.debug("logout onFailure: " + JSON.stringify(response));
    });
```

Sample applications

There are two samples associated with this tutorial:

- **PreemptiveLoginCordova**: An application that always starts with a login screen, using the preemptive `login` API.
- **RememberMeCordova**: An application with a *Remember Me* checkbox. The user can bypass the login screen the next time the application is opened.

Both samples use the same `UserLogin` security check from the **SecurityCheckAdapters** adapter Maven project.

Click to download (https://github.com/MobileFirst-Platform-Developer-Center/RememberMeCordova/tree/release80) the Remember Me project.
Click to download (https://github.com/MobileFirst-Platform-Developer-Center/PreemptiveLoginCordova/tree/release80) the Preemptive Login project.

Sample usage

- Use either Maven or MobileFirst Developer CLI to build and deploy the available **ResourceAdapter** and **UserLogin** adapters (../../../adapters/creating-adapters/).
- From a **Command-line** window, navigate to the project's root folder and run the command: `mfpdev app register`.
- Map the `accessRestricted` scope to the `UserLogin` security check:
    - In the MobileFirst Operations Console, under **Applications → [your-application] → Security → Map scope elements to security checks**, add a scope mapping from `accessRestricted` to `UserLogin`.
    - Alternatively, from the **Command-line**, navigate to the project's root folder and run the command: `mfpdev app push`.

> Learn more about the mfpdev app push/push commands in the Using MobileFirst Developer CLI to manage MobilefFirst artifacts (../../../using-the-mfpf-sdk/using-mobilefirst-developer-cli-to-manage-mobilefirst-artifacts).
