

# Handling Push Notifications in Cordova applications

## Overview

Before iOS and Android Cordova applications are able to receive and display push notifications, the Cordova project needs to be configured with the **cordova-plugin-mfp-push** plug-in. Once an application has been configured, MobileFirst-provided Notifications API can be used in order to register & unregister devices, subscribe & unsubscribe tags and handle notifications.

In this tutorial you learn how to configure a Cordova application and how to use the MobileFirst-provided Notifications API.

### Prerequisites:

- Make sure you have read the following tutorials:
  - Setting up your MobileFirst development environment ([../setting-up-your-development-environment/](#))
  - Preparing the MobileFirst Server for push notification ([../sending-push-notifications/](#))
  - Push Notifications Overview ([../push-notifications-overview](#))
- MobileFirst Server to run locally, or a remotely running MobileFirst Server
- MobileFirst Developer CLI installed on the developer workstation
- Cordova CLI installed on the developer workstation

- Handling a push notification
- Sample application

## Notifications Configuration

Create a new Cordova project or use an existing one.

If the MobileFirst Cordova SDK is not already present in the project, follow the instructions in the Adding the MobileFirst Platform Foundation SDK to Cordova applications ([../adding-the-mfpf-sdk/cordova](#)) tutorial.

## Adding the Push plug-in

1. From a **command-line** window, navigate to the root of the Cordova project.
2. Add the push plug-in to the iOS and/or Android platform by running the command:

```
cordova plugin add cordova-plugin-mfp-push
```

3. Build the Cordova project by running the command:

cordova build

## iOS platform

The iOS platform requires an additional step.

In Xcode, enable push notifications for your application in the **Capabilities** screen.

**❗ Important:** the bundleId selected for the application must match the AppId that you have previously created in the Apple Developer site. See the [Push Notifications Overview] tutorial.

## Notifications API

### Client-side

Javascript Function	Description
<code>MFPPush.initialize(success, failure)</code>	Initialize the MFPPush instance.
<code>MFPPush.isPushSupported(success, failure)</code>	Does the device support push notifications.
<code>MFPPush.registerDevice(success, failure)</code>	Registers the device with the Push Notifications Service.
<code>MFPPush.getTags(success, failure)</code>	Retrieves all the tags available in a push notification service instance.

Javascript Function	Description
<code>MFPPush.subscribe(tag, success, failure)</code>	Subscribes to a particular tag.
<code>MFPPush.getSubscriptions(success, failure)</code>	Retrieves the tags device is currently subscribed to
<code>MFPPush.unsubscribe(tag, success, failure)</code>	Unsubscribes from a particular tag.
<code>MFPPush.unregisterDevice(success, failure)</code>	Unregisters the device from the Push Notifications Service

## API implementation

### Initialization

Initialize the **MFPPush** instance. - Required for the client application to connect to MFPPush service with the right application context.

- The API method should be called first before using any other MFPPush APIs. - Registers the callback function to handle received push notifications.

```
MFPPush.initialize (
  function(successResponse) {
    alert("Successfully intialized");
    MFPPush.registerNotificationsCallback(notificationReceived);
  },
  function(failureResponse) {
    alert("Failed to initialize");
  }
);
```

### Is push supported

Check if the device supports push notifications.

```
MFPPush.isPushSupported (
  function(successResponse) {
    alert("Push Supported: " + successResponse);
  },
  function(failureResponse) {
    alert("Failed to get push support status");
  }
);
```

### Register device

Register the device to the push notifications service.

```
MFPPush.registerDevice(  
  function(successResponse) {  
    alert("Successfully registered");  
  },  
  function(failureResponse) {  
    alert("Failed to register");  
  }  
);
```

*Optional. iOS-only.* Before calling the above `registerDevice` API method, use the `setOptions(options)` API method to enable or disable various options, such as alerts, notification sound, badge and interactive notifications categories.

Read more about the `setOptions(options)` API method in the user documentation.

## Get tags

Retrieve all the available tags from the push notification service.

```
MFPPush.getTags (  
  function(tags) {  
    alert(JSON.stringify(tags));  
  },  
  function() {  
    alert("Failed to get tags");  
  }  
);
```

## Subscribe

Subscribe to desired tags.

```
var tags = ['sample-tag1','sample-tag2'];  
  
MFPPush.subscribe(  
  tags,  
  function(tags) {  
    alert("Subscribed successfully");  
  },  
  function() {  
    alert("Failed to subscribe");  
  }  
);
```

## Get subscriptions

Retrieve tags the device is currently subscribed to.

```
MFPPush.getSubscriptions (
  function(subscriptions) {
    alert(JSON.stringify(subscriptions));
  },
  function() {
    alert("Failed to get subscriptions");
  }
);
```

## Unsubscribe

Unsubscribe from tags.

```
var tags = ['sample-tag1','sample-tag2'];

MFPPush.unsubscribe(
  tags,
  function(tags) {
    alert("Unsubscribed successfully");
  },
  function() {
    alert("Failed to unsubscribe");
  }
);
```

## Unregister

Unregister the device from push notification service instance.

```
MFPPush.unregisterDevice(
  function(successResponse) {
    alert("Unregistered successfully");
  },
  function() {
    alert("Failed to unregister");
  }
);
```

## Handling a push notification

You can handle a received push notification by operating on its response object in the registered callback function.

```
var notificationReceived = function(message) {
  alert(JSON.stringify(message));
};
```

# Sample application

Click to download (<https://github.com/MobileFirst-Platform-Developer-Center/PushNotificationsCordova/tree/release80>) the Cordova project.

## Sample usage

1. From a **Command-line**, navigate to the project's root folder.
2. Add a platform using the `cordova platform add` command.
3. Register the application by running the command: `mfpdev app register`.
4. Via the MobileFirst Operations Console, setup the MobileFirst Server with either GCM details or APNS certificate, and add tags.
5. Run the application by running the `cordova run` command.
