

Invoking adapter procedures from native Windows Phone 8 applications

To create and configure a Windows Phone 8 native project, first follow the [Creating your first Native WP8 MobileFirst application](#) (../hello-world/creating-first-native-windows-phone-8-mobilefirst-application/) tutorial.

This tutorial covers the following topics:

- Initializing WLClient
- Invoking an adapter procedure
- Receiving a procedure response
- Sample application

Initializing WLClient

Copy

```
WLClient client = WLClient.getInstance();
```

1. To establish a connection to MobileFirst Server, use the `connect` method by specifying the `MyConnectResponseListener` class instance as a parameter.

Copy

```
client.connect(new MyConnectResponseListener(this));
```

The `WLClient` instance tries to connect to the MobileFirst Server instance according to the properties of the `wlclient.properties` file.

After the connection is established, it invokes one of the methods of the `MyConnectResponseListener` class.

2. Specify that the `MyConnectResponseListener` class implements the `WLResponseListener` interface.

Copy

```
public class MyConnectResponseListener : WLResponseListener
```

The `WLResponseListener` interface defines two methods:

- `public void onSuccess (WLResponse response) { }`
- `public void onFailure (WLFailResponse response) { }`

3. Use the previous methods to process connection success or connection failure.

Invoking an adapter procedure

After the connection is established with a MobileFirst Server instance, you can use the `WLClient` instance to invoke adapter procedures.

1. Create a `WLProcedureInvocationData` object with the adapter and procedure names.
2. Add the required parameters as an object array and set request options (for example: Invocation Context).
3. Get the existing `WLClient` instance and use it to invoke an adapter procedure.
4. Specify the `MyInvokeListener` class instance as a parameter.

Copy

```
WLProcedureInvocationData invocationData = new WLProcedureInvocationData("RSSReader", "getStories");<br>invocationData.setParameters(new Object[{}]);<br>String myContextObject = "InvokingAdapterProceduresWP8";<br>WLRequestOptions options = new WLRequestOptions();<br>options.setInvocationContext(myContextObject);<br>WLClient.getInstance().invokeProcedure(invocationData, new MyInvokeListener(this), options);<br />
```

Receiving a procedure response

After the procedure invocation is completed, the `WLClient` instance calls one of the methods of the `MyInvokeListener` class.

As before, you must specify that the `MyInvokeListener` class implements the `WLResponseListener` interface.

Copy

```
using IBM.Worklight;<br>namespace InvokingAdapterProceduresWP8{<br>    public class MyInvokeListener :<br>        WLResponseListener<br>    {<br>    {<br>    {
```

The `onSuccess` and `onFailure` methods are invoked by the `WLClient`. The response object contains the response data. You can use its methods and properties to retrieve the required information.

Copy

```
public void onSuccess(WLResponse response)<br>{<br>    WLProcedureInvocationResult invocationResponse = ((WLProcedureInvocationResult) response);<br><br>    JObject items;<br>    try<br>    {<br>        items = invocationResponse.getResponseJSON();<br>        Deployment.Current.Dispatcher.BeginInvoke(() =><br>        {<br>            myMainPage.AddTextToReceivedTextBlock("Response Success: " + items.ToString());<br>        });<br>    }<br>    catch (JsonReaderException e)<br>    {<br>        Deployment.Current.Dispatcher.BeginInvoke(() =><br>        {<br>            myMainPage.AddTextToReceivedTextBlock("JSONException : " + e.Message);<br>        });<br>    }<br>}<br><br>public void onFailure(WLFailResponse response)<br>{<br>    Deployment.Current.Dispatcher.BeginInvoke(() =><br>    {<br>        myMainPage.AddTextToReceivedTextBlock("Response failed: " + response.ToString());<br>    });<br>}<br>}
```

Sample application

Click to download

(<http://public.dhe.ibm.com/software/products/en/MobileFirstPlatform/docs/v700/InvokingAdapterProceduresNativeProject.zip>)
the Studio project.

Click to download

(<http://public.dhe.ibm.com/software/products/en/MobileFirstPlatform/docs/v700/InvokingAdapterProceduresWP8Project.zip>)
the Native project.

The sample contains two projects:

- The `InvokingAdapterProceduresNativeProject.zip` file contains a **MobileFirst Native API** to deploy to MobileFirst Server.
- The `InvokingAdapterProceduresWP8project.zip` file contains a **native Windows Phone 8 application** that uses a MobileFirst native API library to communicate with a MobileFirst Server instance.

Make sure to update the `wlclient.properties` file in `InvokingAdapterProceduresWP8` with the relevant server settings.
