

Java HTTP Adapter

Overview

Java adapters provide free reign over connectivity to your backend. It is therefore your responsibility to ensure best practices regarding performance and other implementation details.

This tutorial covers an example of a Java adapter that connects to an RSS feed by using a Java `HttpClient`.

Prerequisite: Make sure to read the Java Adapters (../) tutorial first.

RSSAdapterApplication

`RSSAdapterApplication` extends `MFPJAXRSApplication` and is a good place to trigger any initialization required by your application.

```
@Override
protected void init() throws Exception {
    RSSAdapterResource.init();
    logger.info("Adapter initialized!");
}
```

RSSAdapterResource

`RSSAdapterResource` is where we handle the requests to your adapter.

```
@Path("/")
public class RSSAdapterResource {
}
```

`@Path("/")` means that the resources will be available at the URL `http(s)://host:port/ProjectName/adapters/AdapterName/`.

HTTP Client

RSSAdapterResource

```
private static CloseableHttpClient client;
private static HttpHost host;

public static void init() {
    client = HttpClients.createDefault();
    host = new HttpHost("developer.ibm.com");
}
```

Because every request to your resource will create a new instance of `RSSAdapterResource`, it is important to reuse objects that may impact performance. In this example we made the Http client a `static` object and initialized it in a static `init()` method, which gets called by the `init()` of `RSSAdapterApplication` as described above.

Procedure resource

RSSAdapterResource

```
@GET
@Produces("application/json")
public void get(@Context HttpServletResponse response, @QueryParam("tag") String tag)
    throws ClientProtocolException, IOException, IllegalStateException, SAXException {
    if(tag!=null && !tag.isEmpty()){
        execute(new HttpGet("/mobilefirstplatform/tag/"+ tag +"/feed"), response);
    }
    else{
        execute(new HttpGet("/mobilefirstplatform/feed"), response);
    }
}
```

Our adapter exposes just one resource URL which allows to retrieve the RSS feed from the backend service.

- `@GET` means that this procedure only responds to `HTTP GET` requests.
- `@Produces("application/json")` specifies the Content Type of the response to send back. We chose to send the response as a `JSON` object to make it easier on the client-side.
- `@Context HttpServletResponse response` will be used to write to the response output stream. This enables us more granularity than returning a simple string.
- `@QueryParam("tag") String tag` enables the procedure to receive a parameter. The choice of `QueryParam` means the parameter is to be passed in the query (`/RSSAdapter/?tag=MobileFirst_Platform`). Other options include `@PathParam`, `@HeaderParam`, `@CookieParam`, `@FormParam`, etc.
- `throws ClientProtocolException, ...` means we are forwarding any exception back to the client. The client code is responsible for handling potential exceptions which will be received as `HTTP 500` errors. Another solution (more likely in production code) is to handle exceptions in your server Java code and decide what to send to the client based on the exact error.
- `execute(new HttpGet("/mobilefirstplatform/feed"), response)`. The actual HTTP request to the backend service is handled by another method defined later.

Depending if you pass a `tag` parameter, `execute` will retrieve a different build a different path and retrieve a different RSS file.

execute()

RSSAdapterResource

```

public void execute(HttpRequest req, HttpServletResponse resultResponse)
    throws ClientProtocolException, IOException,
        IllegalStateException, SAXException {
    HttpResponse RSSResponse = client.execute(host, req);
    ServletOutputStream os = resultResponse.getOutputStream();
    if (RSSResponse.getStatusLine().getStatusCode() == HttpStatus.SC_OK){
        resultResponse.addHeader("Content-Type", "application/json");
        String json = XML.toJson(RSSResponse.getEntity().getContent());
        os.write(json.getBytes(Charset.forName("UTF-8")));
    }
    else{
        resultResponse.setStatus(RSSResponse.getStatusLine().getStatusCode());
        RSSResponse.getEntity().getContent().close();
        os.write(RSSResponse.getStatusLine().getReasonPhrase().getBytes());
    }
    os.flush();
    os.close();
}

```

- `HttpResponse RSSResponse = client.execute(host, req)`. We use our static HTTP client to execute the HTTP request and store the response.
- `ServletOutputStream os = resultResponse.getOutputStream()`. This is the output stream to write a response to the client.
- `resultResponse.addHeader("Content-Type", "application/json")`. As mentioned before, we chose to send the response as JSON.
- `String json = XML.toJson(RSSResponse.getEntity().getContent())`. We used `org.apache.wink.json4j.utils.XML` to convert the XML RSS to a JSON string.
- `os.write(json.getBytes(Charset.forName("UTF-8")))` the resulting JSON string is written to the output stream.

The output stream is then `flushed` and `closed`.

If `RSSResponse` is not `200 OK`, we write the status code and reason in the response instead.

Results

The adapter should return the RSS feed converted to JSON.

    NSLog(@"Got remote Notification. Data : %@", userInfo);
    let info = userInfo as NSDictionary
    let data = info objectForKey(@"aps")?.objectForKey(@"alert") as! NSDictionary
    let userData = data objectForKey(@"body") as! String
    let alertView = UIAlertView(title: @"WishList!", message: @"%@", userData, delegate: nil, cancelButtonTitle: @"OK", otherButtonTitles: nil)
    alertView.show()
}

```

The following are the screenshots of client application.

Migration to On-Prem

Migration of Client Application

Migration of Client Application includes following two steps

Configuring CocoaPods

If CocoaPods has not been installed on a specific computer:

- Follow the [Getting Started](http://guides.cocoapods.org/using/getting-started.html); guide for CocoaPods installation: <http://guides.cocoapods.org/using/getting-started.html>
- Open [Terminal](#); at the installation location and run the `pod init`; command

The following steps assume that the client application is working with CocoaPods. If not, follow this [Using CocoaPods](http://guides.cocoapods.org/using/using-cocoapods.html); documentation : [click here](http://guides.cocoapods.org/using/using-cocoapods.html)

In both cases, the instructions below explain how to edit the `Podfile`; file.

Open the `Podfile`; file located in the root of your XCode project in a favourite text editor.

Comment out or remove the existing content.

Add the following lines:

```

source 'https://github.com/rleigh.ibm.com/vimflocalsdks/vimf-client-sdk-specs.git'
pod 'IMFCompatibility'

```

Open `Terminal`; at the location of `Podfile`;

Verify that the XCode project is closed.

Run the `pod install`; command.

Open the `[MyProject].xcworkspace` file in XCode. This file is located side by side with `[MyProject].xcodeproj`.

An usual CocoaPods-based project is managed as a workspace containing the application (the executable) and the library (all project dependencies brought by the CocoaPods manager).

In Xcode's Build Settings, search for `Other Linker Flags`; and insert `$(inherited)` (if `-ObjC` is defined in this field, you can just delete it, since it is configured in the CocoaPod project).

Client App Migration

Search for `bluemix` dependency imports like

```

#import <IMFCore/IMFCore.h>
#import <IMFPush/IMFPush.h>

```

Replace the above imports with

```

#import <IMFCompatibility/IMFCompatibility.h>

```

Look for a call to the `initWithBackendRoute`; method and replace the route URL with your on-premise server URL. For example:

```

IMFClient.sharedInstance().initWithBackendRoute(@"https://parkstore.mybluemix.net", backendGUID: @"5e3ad88d-dd48-469d-b46f-2c4ad66b5345")

```

should be replaced with your on-premise MFP server URL

```

IMFClient.sharedInstance().initWithBackendRoute(@"http://localhost:9080/ParkStoreMFP", backendGUID: @"5e3ad88d-dd48-469d-b46f-2c4ad66b5345")

```

Note, that `backendGUID` parameter is ignored and can be empty. Look for all instantiations of `IMFResourceRequest` class and update it

Look for all instantiations of `IMFResourceRequest` class and update the request URL with absolute or relative path to the resource. For example:

```

var request: IMFResourceRequest = IMFResourceRequest(path: @"https://parkstore.mybluemix.net/LocalstoreAdapter/apps/5e3ad88d-dd48-469d-b46f-2c4ad66b5345/localstore/getAllItems", method: @"GET")

```

should be replaced with

```

var request: IMFResourceRequest = IMFResourceRequest(path: @"http://localhost:9080/ParkStoreMFP/LocalstoreAdapter/apps/5e3ad88d-dd48-469d-b46f-2c4ad66b5345/localstore/getAllItems", method: @"GET")

```

vp> should be replaced with <vp>

```
var request: IMFResourceRequest = IMFResourceRequest(path: "http://localhost:9080/ParkStoreMFP/adapters/LocalstoreAdapter/localstore/getAllItems";, method: "GET");
```

Add the following code inside didRegisterForRemoteNotificationsWithDeviceToken function in AppDelegate of Client application.

```
WLPush.sharedInstance().tokenFromClient = deviceToken.
```

All on-premise applications require the “worklight.plist” file to be present in the application resources. In the <code>IBMMobileFirstPlatformFoundationNativeSDK</code> pod we supply a file named sample.worklight.plist.

- Locate the “sample.worklight.plist” file in the “IBMMobileFirstPlatformFoundationNativeSDK” pod.
- Copy this file to the parent (application) project and rename it to “worklight.plist”.
- Edit the “worklight.plist” file by setting the “application id” key to the name of your application deployed to the on-premise MFPF server.

Migration of JAX-RS Application to JAVA Adapter

To migrate JAX-RS application to on-prem (Mobile First Foundation) server we need to do the following steps for server:

- Create MobileFirst Project
- Create native API app for iOS

Add two adapters for Custom Authentication and Localstore and migrate the JAX-RS code as shown in the following example.

Copy the JAX-RS BlueMix code and paste it in the newly created Localstore Java adapter JAX-RS file.

Add and remove the following changes in your adapter code.

- remove <code>V{tenantId}</code>
- remove the <code>@PathParam -> PathParam("tenantId") String deviceId</code> and <code>@PathParam("realmName") String realmName</code>
- Add scope to the all http api resource <code>@OAuthSecurity (scope="customAuthRealm_3")</code>

The code looks like the following

```
@GET
@OAuthSecurity (scope="customAuthRealm_3")
@Path("/getAllItems")
public String getAllItems() throws MissingConfigurationException {
    tinit();
    JSONArray jsonArray = new JSONArray();
    for (Object key : props.keySet()) {
        jsonArray.add(parser.parse(props.getProperty((String) key)).getAsJsonObject());
    }
    return jsonArray.toString();
}

@PUT
@OAuthSecurity (scope="customAuthRealm_3")
@Path("/addItem")
public void addItem(String itemJson) throws MissingConfigurationException, URISyntaxException, IOException {
    try {
        tinit();
        int newKey = props.keySet().size()+1;
        props.put(String.valueOf(newKey), itemJson);
        URL url = this.getClass().getClassLoader().getResource("data.properties");
        File file = new File(url.toURI().getPath());
        FileOutputStream foStream = new FileOutputStream(file);
        props.store(foStream, "saving new item");
        foStream.close();
    } catch (IOException ioe) {
        ioe.printStackTrace();
    }
}

@POST
@OAuthSecurity (scope="customAuthRealm_3")
@Path("/addAllItems")
public String addAllItems(String itemsJson) throws MissingConfigurationException, URISyntaxException, IOException {
    try {
        tinit();
        clearAllData();
        JSONArray jsonArr = parser.parse(itemsJson).getAsJsonArray();
        for (int i=0; i<jsonArr.size(); i++) {
            props.put(String.valueOf(i+1), jsonArr.get(i).toString());
        }
        URL url = this.getClass().getClassLoader().getResource("data.properties");
        File file = new File(url.toURI().getPath());
        FileOutputStream foStream = new FileOutputStream(file);
        props.store(foStream, "saving new item");
        foStream.close();
        return "true";
    } catch (IOException ioe) {
        ioe.printStackTrace();
        return "false";
    }
}

@DELETE
@OAuthSecurity(enabled=false)
@Path("/clearAll")
public String clearAllData() throws MissingConfigurationException, URISyntaxException, IOException {
    tinit();
    props.clear();
    System.out.println("Size : "+props.size());
    URL url = this.getClass().getClassLoader().getResource("data.properties");
    File file = new File(url.toURI().getPath());
    FileOutputStream foStream = new FileOutputStream(file);
    props.stor
```

```
e(foStream, &quot;clearing all data&quot;);\n\t\tfoStream.close();\n\t\treturn &quot;cleared&quot;;\n\t}\n</pre>\n<h3 id=\"configoauth\">Configuring Custom-OAuth</h3>\n<ul>\n<li>Add realm with same name you had on BlueMix and login module to the authenticationConfig.xml.\n<pre class=\"brush: xml; title: ; notranslate\">&lt;realm name=\"&quot;customAuthRealm_3&quot;; loginModule=\"&quot;customAuthLoginModule_3&quot;;&gt;\n&lt;className&gt;com.worklight.core.auth.ext.CustomIdentityAuthenticator&lt;\n&lt;className&gt;\n&lt;parameter name=\"&quot;providerUrl&quot;; value=\"&quot;http://localhost:9080/ParkStoreMFP/adapters/CustomAuth&quot;;&gt;\n&lt;\n&lt;\n&lt;realm&gt;\n&lt;\n&lt;loginModule name=\"&quot;customAuthLoginModule_3&quot;; expirationInSeconds=\"&quot;3600&quot;;&gt;\n&lt;className&gt;com.worklight.core.auth.ext.CustomIdentityLoginModule&lt;\n&lt;className&gt;\n&lt;\n&lt;loginModule&gt;\n</pre>\n</li>\n<li>Add Custom-oauth Realm in userIdentityRealms in Application Descriptor file of iOS Native API\n<pre class=\"brush: xml; title: ; notranslate\">&lt;userIdentityRealms&gt;customAuthRealm_3&lt;\n&lt;userIdentityRealms&gt;\n</pre>\n</li>\n<li>Add Custom-oauth Realm in userIdentityRealms in Application Descriptor file of iOS Native API and include the password of added apns certificate.\n<pre class=\"brush: xml; title: ; notranslate\">&lt;pushSender password=\"&quot;password&quot;;&gt;\n&lt;\n&lt;tags&gt;\n&lt;tag&gt;\n&lt;name&gt;parkstore&lt;\n&lt;name&gt;\n&lt;\n&lt;tag&gt;\n&lt;\n&lt;tags&gt;\n</pre>\n</li>\n<li>Create HTTP Push Adapter with following function code which will send the user push notification to the devices which is subscribed to tag &#8220;parkstore&#8221;.\n<pre class=\"brush: xml; title: ; notranslate\">function sendTagNotification(notificationText) {\n  var notificationOptions = {};\n  notificationOptions.message = {};\n  notificationOptions.target = {};\n  notificationOptions.message.alert = notificationText;\n  notificationOptions.target.tagNames = [ &quot;parkstore&quot;];\n  WL.Server.sendMessage(&quot;ParkStoreMFP&quot;, notificationOptions);\n  return {\n    result : &quot;Notification sent to users subscribed to the tag parkstore.&quot;;\n  };\n}\n</pre>\n</li>\n<li>By performing above steps one can easily run iOS app built for Bluemix on MobileFirst Platform and following are the links to samples.\n<h3 id=\"sample\">Sample and Source Code</h3>\n<p>Bluemix Server : <a href=\"https://hub.jazz.net/git/chethan/parkstore-bluemix-server\">Parkstore bluemix server</a><br>\nBluemix Client : <a href=\"https://hub.jazz.net/git/chethan/parkstore-bluemix\">Parkstore bluemix</a><br>\nMFP Server : <a href=\"https://hub.jazz.net/git/chethan/parkstore-mfp-server\">Parkstore mfp server</a><br>\nMFP Client : <a href=\"https://hub.jazz.net/git/chethan/parkstore-mfp\">Parkstore mfp</a></p>\n<p>The post <a rel=\"nofollow\" href=\"https://developer.ibm.com/mobilefirstplatform/2015/08/19/try-on-bluemix-and-buy-mfp/\">Try on Bluemix and migrate to on-prem MobileFirst Platform</a> appeared first on <a rel=\"nofollow\" href=\"https://developer.ibm.com/mobilefirstplatform\">IBM MobileFirst Platform</a>.</p>,\n  \"guid\": {\n    \"content\": \"https://developer.ibm.com/mobilefirstplatform/?p=14769\", \n    \"isPermaLink\": \"false\" \n  },\n  \"link\": \"https://developer.ibm.com/mobilefirstplatform/2015/08/19/try-on-bluemix-and-buy-mfp/\", \n  \"pubDate\": \"Wed, 19 Aug 2015 10:36:51 +0000\", \n  \"title\": \"Try on Bluemix and migrate to on-prem MobileFirst Platform\" \n},\n  \"language\": \"en-US\", \n  \"lastBuildDate\": \"Tue, 08 Sep 2015 09:22:53 +0000\", \n  \"link\": [\n    {\n      \"href\": \"https://developer.ibm.com/mobilefirstplatform/feed\", \n      \"rel\": \"self\", \n      \"type\": \"application/rss+xml\" \n    },\n    \"https://developer.ibm.com/mobilefirstplatform\" \n  ], \n  \"title\": \"IBM MobileFirst Platform\",
