

# Using the MobileFirst Platform Operations Console

fork and edit tutorial (<https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/8.0/setting-up-your-development-environment/console/index.md>) | report issue (<https://github.ibm.com/MFPSamples/DevCenter/issues/new>)

## Overview

The MobileFirst Platform Operations Console is a web-based UI which enables simplified work flows for both the developer and the administrator to create, monitor, secure and administer applications & adapters.

Jump to:

- Accessing the console
- Navigating the console

## Accessing the console

The MobileFirst Operations Console can be accessed in the following ways:

### From a locally installed MobileFirst Server

#### Desktop Browser

From your browser of choice, load the URL `http://localhost:9080/mfpconsole` (`http://localhost:9080/mfpconsole`). The username/password are *admin/admin*.

#### Command-line

From a **Command-line** window, with the MobileFirst CLI installed, run the command: `mfpdev server console`.

### From a remotely installed MobileFirst Server

#### Desktop Browser

From your browser of choice, load the URL `http://the-server-host:server-port-number/mfpconsole`

The host server can be a customer-owner server, or running on a service such as Bluemix. The username/password are *admin/admin*.

#### Command-line

From a **Command-line** window, with the MobileFirst CLI installed,

1. Add a remote server definition:

##### *Interactive Mode*

Run the command: `mfpdev server add` and follow the on-screen instructions.

##### *Direct Mode*

Run the command with the following structure: `mfpdev server add [server-name] --URL [remote-server-URL] --login [admin-username] --password [admin-password] --contextroot [admin-service-name]`. For example:

```
mfpdev server add MyRemoteServer http://my-remote-host:9080/ --login TheAdmin --password ThePassword --contextroot mfpadmin
```

2. Run the command: `mfpdev server console MyRemoteServer`.

Learn more about the various CLI commands in the [Using CLI to manage MobileFirst artifacts](#) ([../using-the-mfpf-sdk/using-cli-to-manage-mobilefirst-artifacts/](#)) tutorial.

## Navigating the console

### Dashboard

The Dashboard provides a glance view of the deployed projects.

The screenshot shows the MobileFirst Operations Console Dashboard. The left sidebar contains navigation links: Dashboard, Runtimes, Applications, Adapters, Settings, Devices, and Error Log. The main content area has a 'Welcome!' message and three buttons: 'Register an App', 'Get CLI', and 'Get Starter Code'. Below this is a 'Monitoring' section with three status indicators: 'Administration DB', 'Configuration Service', and 'Push Service', all marked as 'Active'.

### Runtime settings

Edit runtime properties such as Analytics server URL, global security variables, server keystore and confidential clients.

The screenshot shows the MobileFirst Operations Console Settings page. The left sidebar is the same as the dashboard. The main content area is titled 'Settings' and has three tabs: 'Runtime Properties', 'Keystore', and 'Confidential Clients'. The 'Runtime Properties' tab is active, showing a list of properties. The 'analyticsEnabled' property is set to 'true' and is marked as required. The 'expirationMarginSec' property is set to '2' and is also marked as required. There is an 'Edit' button in the top right corner of the settings area.

# Applications

## Creating applications

Provide basic application values and download Starter Code.

The screenshot shows the 'MobileFirst Operations Console' interface. The left sidebar contains a navigation menu with 'Dashboard', 'Runtimes', 'Applications', 'Adapters', 'Settings', 'Devices', and 'Error Log'. The 'Applications' section is selected, showing a 'New' button and the text 'No application deployed'. The main content area is titled 'Register an Application' and contains the following fields:

- Application Name:** A text input field with a placeholder 'Optional display name of the Application'.
- Choose Platform:** Three radio buttons: 'Android', 'iOS' (selected), and 'Windows'.
- Bundle ID:** A text input field with a placeholder 'Application Identifier; case sensitive'.
- Version:** A text input field with a placeholder 'Application Version'.

At the bottom of the form is a blue button labeled 'Register application'. The top right of the console shows 'Analytics Console', 'Hello, admin', and an information icon.

## Managing applications

Manage and configure registered applications by use of Direct Update (../using-the-mfpf-sdk/direct-update/), Remote Disable, Application Authenticity (../authentication-and-security/application-authenticity/), and setting security parameters (../authentication-and-security/authorization-concepts/).

The screenshot shows the 'MobileFirst Operations Console' interface for managing a specific application. The left sidebar shows the navigation menu with 'MyApp' selected under 'Applications'. The main content area is titled 'MyApp' and shows 'iOS v 1.0 | com.sample.myapplication'. The 'Management' tab is selected, showing the following information:

- Last modified:** Feb 15, 2016, 10:40 PM
- Application Access:** A section with a 'Status:' label and three radio buttons: 'Active' (selected), 'Active and Notifying', and 'Access Disabled'.
- Direct Update:** A section with the text 'Deliver an update to a Cordova cross-platform application by uploading a new web resources (HTML, JavaScript, and CSS) archive.' and a blue button labeled 'Upload Web Resources File'.

The top right of the console shows 'Analytics Console', 'Hello, admin', and an information icon.

## Authentication and Security

Configure application security parameters, such as the default token expiration value, map scope elements to security checks, define, mandatory application scopes and configure security check options.

## Notifications

Set-up push notifications (.../notifications/push-notifications-overview/) and related parameters, such as certificates and GCM details, define tags, as well as send notifications to devices.

## Adapters

### Creating adapters

Register an adapter and download Starter Code, as well as update an adapter on-the-fly by updating its properties without needing to re-build and re-deploy the adapter artifact.

The screenshot shows the 'Create a new Adapter' page in the MobileFirst Operations Console. The left sidebar contains a navigation menu with 'Dashboard', 'Runtimes', 'mfp', 'Applications' (with a 'New' button), 'Adapters' (with a 'New' button), 'Settings', 'Devices', and 'Error Log'. The main content area has a breadcrumb 'Home > mfp > Create a new Adapter' and an 'Actions' dropdown with a 'Deploy Adapter' button. The title is 'Create a new Adapter'. Below it, a paragraph explains that adapters are used to connect back-end systems to client applications and cloud services. A section titled 'Follow these steps to create an adapter' includes a 'Hide guide' link and a numbered list starting with '1 Set up your development environment'. This section contains text about using Maven or the MobileFirst Platform Foundation command line tool, a sub-section 'Installing the command line interface (CLI)' with instructions to download Node.js and install the CLI using npm, a code block with the command `npm install -g mfpdev-cli`, and a sub-section 'Installing Maven' with a link to the Apache Maven website.

## Adapter properties

After an adapter is deployed, it can be configured in the console.

The screenshot shows the 'javaAdapter' configuration page in the MobileFirst Operations Console. The left sidebar is similar to the previous screenshot but includes 'Settings' and 'Applications' (with a 'Create new' button). The main content area has a breadcrumb 'Home > mfp > javaAdapter' and a 'Delete' button. The title is 'javaAdapter'. Below it, there are tabs for 'Configurations', 'Resources' (which is active), and 'Configuration Files'. The 'Resources' tab displays a table with the following data:

URL	Methods	Security
/users	GET	
/users/hello/UserQuery	GET	
/users/newUsers	PUT	
/users/{first}/{middle}/{last}	POST	
/users/{username}	GET	

## Devices

Administrators can search for devices that access the MobileFirst Server and can manage access rights. Devices can be searched for using either user ID or using a friendly name. The user ID is the identifier that was used to log-in.

A friendly name is a name that is associated with the device to distinguish it from other devices that share the user ID.

For more information, see the topic about device access management in the MobileFirst Operations Console in the user documentation.

## Client logs

Administrators can use log profiles to adjust client logger configurations, such as log level and log package filters, for any combination of operating system, operating system version, application, application version, and device model.

When an administrator creates a configuration profile, the log configuration is concatenated with responses API calls such as `WLResourceRequest`, and is applied automatically.

For more information, see the topic about client-side log capture configuration from MobileFirst Operations Console in the user documentation.

## Error log

The Error log shows a list of the failed management operations that were initiated from the MobileFirst Operations Console, or from the command line, on the current runtime environment. Use the log to see the effect of the failure on the servers.

For more information, see the topic about error log of operations on runtime environments in the user documentation.

## License tracking

Accessible from the top Settings buttons.

License terms vary depending on which edition (Enterprise or Consumer) of MobileFirst Platform Foundation is being used. License tracking is enabled by default and tracks metrics relevant to the licensing policy, such as active client devices and installed applications. This information helps determine whether the current usage of MobileFirst Platform is within the license entitlement levels and can prevent potential license violations.

By tracking the usage of client devices and determining whether the devices are active, administrators can decommission devices that should no longer be accessing the service. This situation might arise if an employee has left the company, for example.

For more information, see the topic about license tracking in the user documentation.

## Downloads

For situations where Internet connectivity is not available, you can download a snapshot of the various development artifacts of MobileFirst Platform Foundation from the Downloads page.
