

# Resource request from hybrid client applications

## Overview

MobileFirst applications can access resources using the `WLResourceRequest` REST API. The REST API works with all adapters and external resources (`../../authentication-security/using-mobilefirst-server-authenticate-external-resources/`), and is supported in the following hybrid environments: iOS, Android, Windows Phone 8, and Windows 8.

If your application supports other hybrid environments such as BlackBerry, Mobile Web, or Desktop Browser, see the tutorial for IBM MobileFirst Platform Foundation 6.3 (`file:///home/travis/build/MFPSamples/DevCenter/_site/tutorials/en/foundation/6.3/server-side-development/invoking-adapter-procedures-hybrid-client-applications/`).

This tutorial explains how to use the `WLResourceRequest` API with an HTTP adapter.

## WLResourceRequest

```
1  var resourceRequest = new WLResourceRequest(  
2    "/adapters/RSSReader/getFeedFiltered",  
3    WLResourceRequest.GET  
4  );
```

The `WLResourceRequest` class handles resource requests to MobileFirst adapters or external resources.

The parameters for the constructor are:

- **request URL:** To access an adapter within the same project, the URL should be `/adapters/AdapterName/procedureName`.  
To access resources outside of the project, use the full URL.
- **HTTP method:** Most commonly `WLResourceRequest.GET` or `WLResourceRequest.POST`
- **timeout:** optional, request timeout in milliseconds

## setQueryParameter

```
1  resourceRequest.setQueryParameter("params", ["MobileFirst_Platform"]);
```

By using the `setQueryParameter` method, you can include query (URL) parameters in the REST request.

- In MobileFirst JavaScript adapters, which use ordered nameless parameters, pass an array of parameters with the name `params`.
- In Java adapters or external resources, use `setQueryParameter` for each parameter.

```
1 resourceRequest.setQueryParameter("param1", "value1");
2 resourceRequest.setQueryParameter("param2", "value2");
```

## send(body)

```
1 resourceRequest.send().then(
2     onSuccess,
3     onFailure
4 );
```

The `send()` method triggers the request.

Using JavaScript promises, you can define `onSuccess` and `onFailure` functions.

The `send` method takes an optional parameter to set a body to the HTTP request, which could be a JSON object or a simple string.

## sendFormParameters(json)

To send URL-encoded form parameters, use the `sendFormParameters(json)` method instead. This method converts the JSON to a URL encoded string, sets the content-type to `application/x-www-form-urlencoded`, and sets it as the HTTP body.

For more information about `WLResourceRequest`, see the API reference in the user documentation.

## Results

Both the `onSuccess` and `onFailure` callbacks receive a response object, which typically contains the following properties:

- **status**: The HTTP response status
- **responseJSON**: An object that contains the data that is returned by the invoked procedure, and additional information about the procedure invocation.

The object is returned to a corresponding success/failure handler.

```

1  {
2    "errors": [],
3    "info": [],
4    "warnings": [],
5    "isSuccessful": true,
6    "responseHeaders": {
7      "Cache-Control": "no-cache, must-revalidate, post-check=0, pre-check=0"
8    },
9    "responseTime": 491,
10   "statusCode": 200,
11   "statusReason": "OK",
12   "totalTime": 592,
13   "Items": [{
14     "creator": "Jon Fingas",
15     "link": "http://www.engadget.com/2014/11/10/harvard-used-cameras-to-check-attendance/?ncid=rss",
16     "pubDate": "Mon, 10 Nov 2014 02:21:00 -0500",
17     "title": "Harvard used cameras to track attendance without telling students"
18   }, {
19     "creator": "Jon Fingas",
20     "link": "http://www.engadget.com/2014/11/10/bmw-ev-charging-street-lights/?ncid=rss_truncated",
21     "pubDate": "Mon, 10 Nov 2014 00:10:00 -0500",
22     "title": "BMW's new street lights will charge your electric car"
23   }, {
24     "creator": "Daniel Cooper",
25     "link": "http://www.engadget.com/2014/11/09/hwyc-lumia-925/?ncid=rss_truncated",
26     "pubDate": "Sun, 09 Nov 2014 22:43:00 -0500",
27     "title": "How would you change Nokia's Lumia 925?"
28   }
29  ]
30 }

```

- errors, info, and warnings are optional arrays of strings that contain messages.
- The isSuccessful property is set to true if the procedure invocation succeeded (even if no data was retrieved), or to false otherwise.
- The response can contain other metadata such as responseHeaders, responseTime, statusCode, statusReason, and totalTime.

## Handling the result

The rest of the invocation result depends on what was retrieved from the back-end system. In this example, the Items element is a JSON representation of the XML code that was received from the back end, after the rules in the XSL file were applied.

```

1  function loadFeedsSuccess(result){
2    WL.Logger.debug("Feed retrieve success");
3    if (result.responseJSON.Items.length > 0)
4      displayFeeds(result.responseJSON.Items);
5  }

```

# Sample application

Click to download (<https://github.com/MobileFirst-Platform-Developer-Center/InvokingAdapterProcedures>) the MobileFirst project.

The sample uses the HTTP adapter created in the HTTP Adapter tutorial ([../javascript-adapters/js-http-adapter](#)).
