

# Debugging Adapters

fork and edit tutorial (<https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/7.0/server-side-development/debugging-adapters.html>) | report issue (<https://github.ibm.com/MFPSamples/DevCenter/issues/new>)

## Overview

The available debugging options for adapters are:

- Testing Adapter Procedures
- Debugging Java Adapters

## Testing the adapter procedures

### CLI

In the terminal, within your project, use `$ mfp adapter call` and follow the interactive menu to test an adapter. Make sure the adapter is built and deployed before you try.

### Studio

It is possible to test adapter procedures by using MobileFirst Studio.

Testing a procedure is done by right-clicking an adapter folder and selecting **Run As > Call MobileFirst Adapter**.

After selecting to call the adapter, you can select the procedure you wish to run. you can also enter comma-separated parameters if the selected procedure requires that.

Call MobileFirst Procedure

Adapter Name : MyAdapter

Procedure name :
getStories (interest)

REST Call Type :
GET

Procedure Arguments

Headers

| Key      | Value |
|----------|-------|
| interest |       |
|          |       |
|          |       |
|          |       |
|          |       |
|          |       |
|          |       |
|          |       |
|          |       |
|          |       |

Load

Save

Remember to surround strings with quotes.

Run

Cancel

Adapter invocation result:

Invocation Result of procedure: 'getStories' from the MobileFirst Server:

# Debugging Java Adapters

To debug Java adapter code, you must use Eclipse in debug mode. This required the MobileFirst Studio (you can import you CLI project if needed).

## Starting debug mode

1. Right-click a Java adapter, then select **Debug As -> Debug MobileFirst Java Adapters**.
2. Optional: Open the debug perspective in MobileFirst Studio.

After you entered debug mode, you can debug the Java code normally, as you would do a standard Java application. You might need to issue a request to the adapter to make its code run and hit the breakpoints.

## Stopping debug mode

1. Open the debug perspective in MobileFirst Studio.
2. On the **Debug** tab, right-click the item **remote debug [Remote Java Application]** -> **Terminate**.
