

Implementing the challenge handler in iOS applications

Overview

Prerequisite: Make sure to read the **CredentialsValidationSecurityCheck**'s challenge handler implementation (`../../credentials-validation/ios/`) tutorial.

The challenge handler will demonstrate a few additional features (APIs) such as the preemptive `login`, `logout` and `obtainAccessTokenForScope`.

Login

In this example, `UserLogin` expects *key:values* called `username` and `password`. Optionally, it also accepts a boolean `rememberMe` key that will tell the security check to remember this user for a longer period. In the sample application, this is collected using a boolean value from a checkbox in the login form.

`credentials` is a `JSONObject` containing `username`, `password` and `rememberMe`:

```
self.submitChallengeAnswer(credentials);
```

You may also want to login a user without any challenge being received. For example, showing a login screen as the first screen of the application, or showing a login screen after a logout, or a login failure. We call those scenarios **preemptive logins**.

You cannot call the `submitChallengeAnswer` API if there is no challenge to answer. For those scenarios, the MobileFirst Platform Foundation SDK includes the `login` API:

```
WLAuthorizationManager.sharedInstance().login(self.securityCheck, withCredentials: credentials) { (error) -> Void in
    if(error != nil){
        NSLog("Login Preemptive Failure: " + String(error))
    }
    else {
        NSLog("Login Preemptive Success")
    }
}
```

If the credentials are wrong, the security check will send back a **challenge**.

It is the developer's responsibility to know when to use `login` vs `submitChallengeAnswer` based on the application's needs. One way to achieve this is to define a boolean flag, for example `isChallenged`, and set it to `true` when reaching `handleChallenge` or set it to `false` in any other cases (failure, success, initializing, etc).

When the user clicks the **Login** button, you can dynamically choose which API to use:

```

if(!self.isChallenged){
    WLAAuthorizationManager.sharedInstance().login(self.securityCheck, withCredentials: credentials) { (err
or) -> Void in}
}
else{
    self.submitChallengeAnswer(credentials)
}

```

Note: WLAAuthorizationManager's login() API has its own completion handler, the relevant challenge handler's handleSuccess or handleFailure will **also** be called.

Obtaining an access token

Since this security check supports *remember me* functionality, it would be useful to check if the client is currently logged in, during the application startup.

The MobileFirst Platform Foundation SDK provides the obtainAccessTokenForScope API to ask the server for a valid token:

```

WLAAuthorizationManager.sharedInstance().obtainAccessTokenForScope(scope) { (token, error) -> Void
in
    if(error != nil){
        NSLog("obtainAccessTokenForScope failed: " + String(error))
    }
    else{
        NSLog("obtainAccessTokenForScope success")
    }
}

```

Note: WLAAuthorizationManager's obtainAccessTokenForScope() API has its own completion handler, the relevant challenge handler's handleSuccess or handleFailure will **also** be called.

If the client is already logged-in or is in the *remembered* state, the API will trigger a success. If the client is not logged in, the security check will send back a challenge.

The obtainAccessTokenForScope API takes in a **scope**. The scope can be the name of your **security check**.

Learn more about **scope** in the Authorization concepts (../authorization-concepts) tutorial

Retrieving the authenticated user

The challenge handler's handleSuccess method receives a dictionary success as a parameter. If the security check sets an AuthenticatedUser, this object will contain the user's properties. You can use handleSuccess to save the current user:

```

override func handleSuccess(success: [NSObject : AnyObject]!) {
    self.isChallenged = false
    self.defaults.setObject(success["user"]!["displayName"]! as! String, forKey: "displayName")
}

```

Here, `success` has a key called `user` which itself contains a dictionary representing the `AuthenticatedUser`:

```
{
  "user": {
    "id": "john",
    "displayName": "john",
    "authenticatedAt": 1455803338008,
    "authenticatedBy": "UserLogin"
  }
}
```

Logout

The MobileFirst Platform Foundation SDK also provides a `Logout` API to logout from a specific security check:

```
WLAuthorizationManager.sharedInstance().logout(self.securityCheck){ (error) -> Void in
if(error != nil){
  NSLog("Logout Failure: " + String(error))
}
}
```

Sample applications

There are two samples associated with this tutorial:

- **PreemptiveLoginSwift**: An application that always starts with a login screen, using the preemptive `login` API.
- **RememberMeSwift**: An application with a *Remember Me* checkbox. The user can bypass the login screen the next time the application is opened.

Both samples use the same `UserLogin` security check from the **SecurityCheckAdapters** adapter Maven project.

Click to download (<https://github.com/MobileFirst-Platform-Developer-Center/SecurityCheckAdapters/tree/release80>) the `SecurityCheckAdapters` Maven project.

Click to download (<https://github.com/MobileFirst-Platform-Developer-Center/RememberMeSwift/tree/release80>) the `Remember Me` project. Click to download (<https://github.com/MobileFirst-Platform-Developer-Center/PreemptiveLoginSwift/tree/release80>) the `Remember Me` project.

Sample usage

- Use either Maven or MobileFirst Developer CLI to build and deploy the available **ResourceAdapter** and **UserLogin** adapters (`../../creating-adapters/`).
- Ensure the sample is registered in the MobileFirst Server by running the command: `mfpdev app register` from a **command-line** window.
- Map the `accessRestricted` scope to the `UserLogin` security check:
 - In the MobileFirst Operations Console, under **Applications** → **[your-application]** → **Security** → **Map scope elements to security checks**, add a mapping from `accessRestricted` to `UserLogin`.

- Alternatively, from the **Command-line**, navigate to the project's root folder and run the command: `mfpdev app push`.

Learn more about the mfpdev app push/push commands in the Using MobileFirst Developer CLI to manage MobileFirst artifacts ([../../using-the-mfpf-sdk/using-mobilefirst-developer-cli-to-manage-mobilefirst-artifacts](#)).
