

API Connect

Overview

IBM API Connect is a cloud-based API Management solution that allows you to design, control, secure, publish, manage, analyze, and scale your API with its simple-to-use configuration and coding platform. To learn more about IBM API Connect, visit the IBM API Connect Developer Center (<https://developer.ibm.com/apiconnect/>).

IBM MobileFirst Foundation integrates its security capabilities with IBM API Connect by using the MobileFirst OAuth Provider API template, which allows you to:

1. Protect API Connect endpoints with the MobileFirst Server as the authorization server.
2. Proxy MobileFirst client non-resource requests and responses through DataPower to the MobileFirst Server that is located behind the DMZ.

Currently the security integration of MobileFirst and API Connect is supported only when DataPower is used as the Gateway server ("Edge Gateway").

The security integration is supported for both API Connect on-premise deployment

(http://www.ibm.com/support/knowledgecenter/SSMNED_5.0.0/com.ibm.apic.install.doc/overview_installing_apimgmt.html) and API Connect BlueMix Service (<https://console.ng.bluemix.net/docs/services/apiconnect/index.html>)

Jump to

- Prerequisites
- Protect the API Connect endpoint with MobileFirst as an authorization server
- Update PinCodeAndroid sample client application
- Support for multiple MobileFirst OAuthProviders

Prerequisites

- API Connect DataPower (Edge) version 5040 or later
- IBM® DataPower® Gateway 7.5.X or later
- MobileFirst CLI
- Completing the Implementing the challenge handler in Android applications

(<https://mobilefirstplatform.ibmcloud.com/tutorials/en/foundation/8.0/authentication-and-security/credentials-validation/android/>) tutorial, which uses the PinCodeAndroid sample (<https://github.com/MobileFirst-Platform-Developer-Center/PinCodeAndroid/tree/release80>)

Protect the API Connect endpoint with MobileFirst as an authorization server

After completing this tutorial and the PinCode sample you will have:

1. An Android application with the `PinCodeChallengeHandler` for the `PinCodeAttempts` security check adapter.
2. A `ResourceAdapter` that protects the `/balance` endpoint with the `accessRestricted` scope.
3. A `PinCodeAttempts` security check adapter which is mapped to the `accessRestricted` scope for the Android application.

Define Confidential Client in MobileFirst Operations Console

Go to MobileFirst Operations Console:

1. In the **Runtime Settings** choose the **Confidential Clients** tab.
2. Click the **New** button.
3. Provide the following values and save:
 - **Display Name:** `API Connect`
 - **ID:** `apic`
 - **Secret:** `YOUR-CLIENT-SECRET`
 - **Allowed Scope:** `authorization.introspect`

Add the API Connect TLS Profile for the MobileFirst HTTPS endpoint

This step is optional and necessary only if you want to send requests to the MobileFirst HTTPS endpoint from API Connect. In order to create an API Connect TLS Profile, you should have your MobileFirst Server certificate (and its password).

See TLS profiles

(http://www.ibm.com/support/knowledgecenter/SSMNED_5.0.0/com.ibm.apic.apionprem.doc/task_apionprem_ssl.html) for information on adding TLS profiles to API Connect in the API Manager.

Import the MobileFirst OAuthProvider template

From the API Designer, create an OAuthProvider REST API by importing the Swagger template YAML file (https://hub.jazz.net/git/imflocalsdk/console-tools-and-sdks/contents/master/mobilefirst-ouath-provider_1.0.0.yaml) (`mobilefirst-ouath-provider_1.0.0.yaml`).

For more information, see Adding a REST API by using an OpenAPI (Swagger 2.0) file

(http://www.ibm.com/support/knowledgecenter/SSMNED_5.0.0/com.ibm.apic.apionprem.doc/create_api_swagger.html).

After importing, different configuration options are displayed and the **Design** tab is selected. Navigate to the **Assemble** tab.

You will see the following components in the assembly flow for the MobileFirst OAuth Provider API:

- MobileFirst Configuration
- gatewayscript
- proxy

- gatewayscript

Configure the MobileFirst OAuthProvider template

Using the API Designer, configure the imported API.

1. From the **Assemble** tab choose the **MobileFirst Configuration** component.
2. In the **MobileFirst Configuration** component, update the following variable values:
 - **mfp-oauth-type**: Leave the default value (**true**).
 - **mfp-server-url**: The MobileFirst Server URL in the format `protocol://server-host:port`. For example **http://myMobileFirstServer:9080**. You can find this value in the `mfpclient.properties` file (see the `wlServerProtocol`, `wlServerHost` and `wlServerPort` properties).
 - **mfp-server-context**: The MobileFirst Server context. Find this value in the `mfpclient.properties` file (see the `wlServerContext` property).
 - **mfp-client-id**: `apic`, as configured in the MobileFirst Operations Console. **Runtime Settings** → **Confidential Clients** for the `authorization.introspect` scope.
 - **mfp-client-secret**: `YOUR-CLIENT-SECRET`, as configured in the MobileFirst Operations Console. **Runtime Settings** → **Confidential Clients** for the `authorization.introspect` scope.

Note: If you configured HTTPS protocol in the previous step for `mfp-server-url`, configure API Connect with a TLS Profile in the **proxy** policy component. Go to the **proxy** policy component in the **Assemble** tab and select for the **TLS Profile** property the profile you previously created in **"Add API Connect TLS Profile for MobileFirst HTTPS endpoint"**.

Get the full URL path of MobileFirst OAuthProvider for `/oauth2/authorize`

Choose and configure a Catalog for your product, and set the full path:

1. Open the **Dashboard**.
2. Choose a catalog (for example **Sandbox**) for your product.
3. Go to **Settings** → **Endpoints** and copy the **Base URL** which has the following format:
`https://{DataPowerGateway}/{organizationName}/{catalogName}`
4. To determine full URL path of MobileFirst OAuthProvider for `/oauth2/authorize`, concatenate the **Base Path** value of the **MobileFirst OAuthProvider** (`/mfpProvider`) and the `/oauth2/authorize` endpoint.

The full URL of the MobileFirst OAuthProvider should look like this:

`https://{DataPowerGateway}/{organizationName}/{catalogName}/mfpProvider/oauth2/authorize`

Create a Simple REST API in API Connect

In this example we create an API called **Branches** and a Product called **Bank** (Based on API Connect's tutorial for Creating an invoke REST API definition (http://www.ibm.com/support/knowledgecenter/SSMNED_5.0.0/com.ibm.apic.toolkit.doc/tutorial_apionprem_apiproxy.html)).

From the API Connect Designer **APIs** tab:

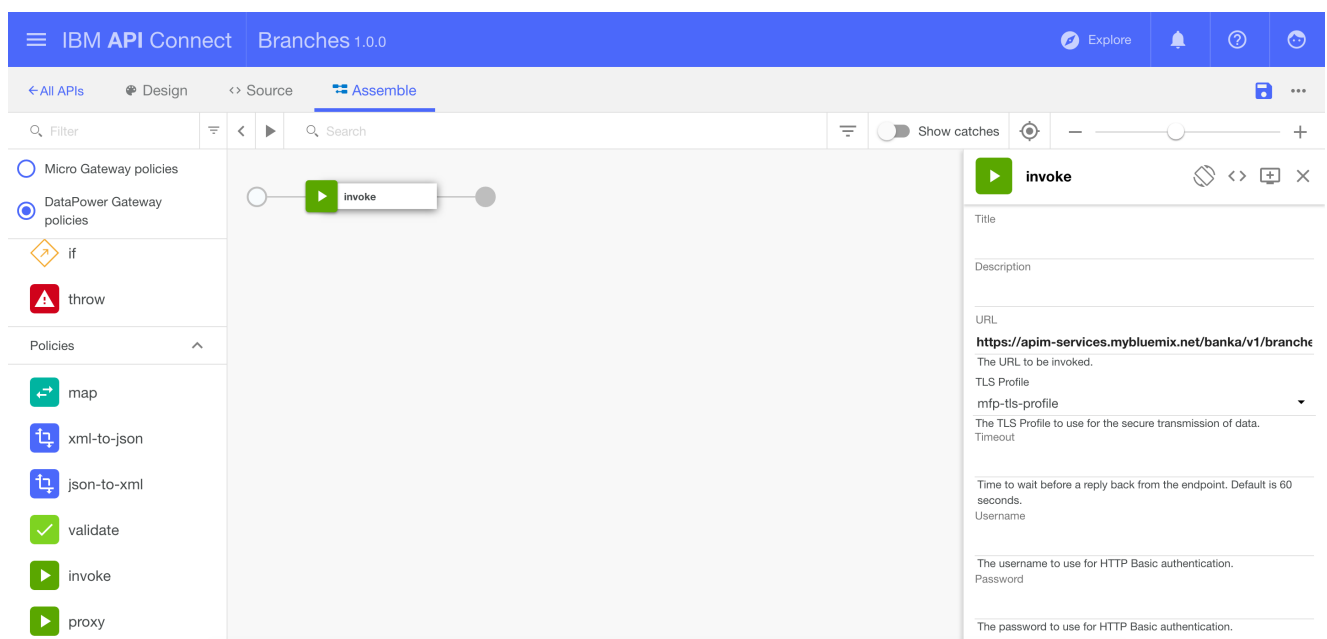

1. To create a REST API definition, click the **+** add button and then select **New OpenAPI from scratch**.
2. Configure the following parameters and click on **Add** button to create the API:
 - Title**: Branches
 - Name**: branches
 - Base Path**: `/branches`
 - Version**: 1.0.0
3. The **Design** tab of the REST API will be displayed.
4. In the **Base Path** section, verify the field is already populated with `/branches`.
5. Go to **Paths** section and create a path by clicking the **Add Path** **+** icon.
6. In the **Path** field enter `/details` (`GET` method is created by default).

- Go to the **Assemble** tab and click the **invoke** policy component that appears in the **Assemble** pane.

- In the properties sheet pane, populate the **URL** field with the back-end resource URL to be protected with MobileFirst. The other values are optional. For this tutorial use `https://apim-services.mybluemix.net/banka/v1/branches`.

- Click the **Save** button  to save the API definition.

Protect the API using the MobileFirst OAuth Security Definition

Protect the API by defining a **Security Definition**.

- In the newly created Branches API, choose **Security Definition** from the design list click the  button to add a definition of the type **OAuth**.

- Set the values:

- **Flow:** Choose **Implicit**.
- **Authorization URL:** Use the full URL path of MobileFirst OAuthProvider for `/oauth2/authorize`, which should be like `https://{DataPowerGateway}/{organizationName}/{catalogName}/mfpProvider/oauth2/authorize`.
- **Scopes:** `accessRestricted`.

- Go to the **Paths** section and choose the `/details` path.
- Click on the **GET** method and expand it.
- In the **Security** section, uncheck **Use API security definitions** and check the newly created **MobileFirst OAuth Security Definition** from the list.

Security

☐ Use API security definitions

Option 1 ☒ MobileFirst OAuth Security Definition (OAuth) ☐ clientIdHeader (API Key)

- Click the **Save** button .

Add the APIs to product and publish it

From the API Connect Designer **Products** tab:

- To create a Product definition, click the  add button and then select **New Product from scratch**.
- Configure the following parameters:
Title: Bank
Name: bank
Version: 1.0.0
- Click the **Create product** button to create the API. The **Design** tab of the Product will be displayed.
- Go to the **APIs** section click **Add** .

- Add the two newly created APIs: **MobileFirst OAuthProvider** and **Branches**.

Select APIs

Select the APIs to include in this product. Any APIs removed from this list will also be removed from the plans in this product.

🔍 Search APIs

<input checked="" type="checkbox"/>	MobileFirstOAuthProvider	1.0.0
<input checked="" type="checkbox"/>	Branches	1.0.0

Apply

6. Save the Product. 

7. Stage the Product. See Staging a Product

(http://www.ibm.com/support/knowledgecenter/en/SSMNED_5.0.0/com.ibm.apic.toolkit.doc/task_deploy_product_offline.html) for more details.

Success Bank (version 1.0.0) has been staged in Sandbox

8. Publish the Product: Go to the Catalog **Dashboard** and choose **Bank** product to publish. See Publish a Product

(http://www.ibm.com/support/knowledgecenter/en/SSMNED_5.0.0/com.ibm.apic.apionprem.doc/publishing_a_product.html) for more details.

Title	State
Bank bank:1.0.0	Staged a few seconds ago ...
<button>Publish</button>	

Title	State
Bank bank:1.0.0	Published a few seconds ...

Update PinCodeAndroid sample client application

Update the `wlclient.properties` file

After setting up the **PinCodeAndroid** sample and completing the setup described in the `README` file, the `wlclient.properties` is configured to send all MobileFirst requests directly to MobileFirst Server.

However, when working with APIC Connect, the client application requests are proxied by the API Connect endpoints which is exposed by the MobileFirst OAuthProvider.

In order to enable the proxy, the following changes are required in the `wlclient.properties` file:

- **wlServerProtocol:** Change to `https`.
- **wlServerHost:** Change to DataPower Gateway hostname (or IP) as it appears in the base URL.
- **wlServerPort:** Change to 443.
- **wlServerContext:** Change to the relative base path of the MobileFirst OAuthProvider. For example `/ {organizationName} / {catalogName} / mfpProvider /`.

Update the `WLResourceRequest` request

In the MobileFirst tutorial sample code, change the following in the `MainActivity.java` code.

Replace this:

```
WLResourceRequest request = new WLResourceRequest(adapterPath, WLResourceRequest.GET);
```

with this:

```
String apicPath = "YOUR_APIC_ENDPOINT_PATH_WHICH_IS_PROTECTED_BY_MOBILEFIRST";
URI apicPathUri = new URI(apicPath);
WLResourceRequest request = new WLResourceRequest(apicPathUri, WLResourceRequest.GET);
```

Note: For the API Connect endpoint path (apicPath) you must supply the full URL, constructed as follows:
`https://{DataPowerGateway}/{organizationName}/{catalogName}/branches/details`

Add SSL certificate to client for API Connect HTTPS endpoint

If you use API Connect BlueMix Service, please skip this step.

API Connect supports HTTPS endpoints only, which may require adding self-signed SSL certificate to your device/emulator while developing your client application. For example in Android, you may see the following Exception:

```
javax.net.ssl.SSLHandshakeException: java.security.cert.CertPathValidatorException: Trust anchor for certification path not found
```

For on-premise deployment, API Connect uses by default its own self-signed SSL certificate, which currently isn't signed with v3_ca extension. Self-signed SSL certificate without v3_ca extension can't be added to some of the mobile devices (like Android).

In order to avoid the SSL exception, you can do one the following:

1. Replace the default API Connect SSL certificate with your own:

- Create self-signed certificate using OpenSSL:

```
#!/bin/sh
#
# Replace DATAPOWER_GW_HOSTNAME with real hostname
HOST=DATAPOWER_GW_HOSTNAME
PRIVATEKEY=${HOST}_private.pem
PUBLICKEY=${HOST}_public.pem
P12FILE=$HOST.p12
P12PWD=passw0rd
P12LABEL=$HOST
# This creates the public and private keys in PEM format
openssl req -x509 -nodes -days 999 -newkey rsa:2048 -keyout "$PRIVATEKEY" -out "$PUBLICKEY" -reqexts v3_req -extensions v3_ca -subj /
C=us/O=ibm/CN=$HOST
# This creates a password-protected pkcs12 file so that the private key that can be imported into API Connect
openssl pkcs12 -export -in "$PUBLICKEY" -inkey "$PRIVATEKEY" -out "$P12FILE" -passout pass:"$P12PWD" -name "$P12LABEL"
```

- You should have three output files, however only the following will be used:
 - **DATAPOWER_GW_HOSTNAME.p12** – Password-protected pkcs12 file for importing it to API Connect TLS Profile.
 - **DATAPOWER_GW_HOSTNAME_public.pem** – Public certificate to install into the device as a trusted CA.
- Create TLS Profile for it in CMC (Use the password you set on P12PWD). See TLS profiles (http://www.ibm.com/support/knowledgecenter/SSMNED_5.0.0/com.ibm.apic.apionprem.doc/task_apionprem_ssl.html)
- Bind the TLS Profile you created with the gateway service. See Binding a TLS profile to an existing gateway service (http://www.ibm.com/support/knowledgecenter/SSMNED_5.0.0/com.ibm.apic.cmc.doc/bind_ssl_existing_gateway.html)
- Install the certfcae you created **DATAPOWER_GW_HOSTNAME_public.pem** on the device. See Installing the root CA on Android (http://www.ibm.com/support/knowledgecenter/SSHS8R_7.1.0/com.ibm.worklight.installconfig.doc/admin/t_installing_root_CA_android.html) or Installing the root CA on iOS (http://www.ibm.com/support/knowledgecenter/en/SSHSCD_7.1.0/com.ibm.worklight.installconfig.doc/admin/t_installing_root_CA_iOS.html) for more details.

2. Adding API Connect default certificate to TrustStore in the client application code (for development):

- Fetch the default API Connect certificate using OpenSSL:

```
openssl s_client -connect {DATAPOWER_GW_HOSTNAME}:443 | openssl x509 > apic-certificate.crt
```
- Add relevant code to your client application to trust API Connect certificate and its hostname. You can follow Security with HTTPS and SSL (<https://developer.android.com/training/articles/security-ssl.html>) for more details in Android.

See Configuring SSL by using untrusted certificates

(http://www.ibm.com/support/knowledgecenter/SSHSCD_7.1.0/com.ibm.worklight.installconfig.doc/admin/c_ssl_config.html) for more details on how to add untrusted certificate to your client application.

Support for multiple MobileFirst OAuthProviders

To add additional OAuthProviders, alter the Swagger template each time before re-importing:

1. **x-ibm-name:** Change "mobilefirst-ouath-provider" to another unique name (using only lowercase).
2. **basePath:** Change "/mfpProvider" to another unique path.
3. **title:** Change "MobileFirstOAuthProvider" to a unique title.

4. **description:** Change "MobileFirst OAuthProvider Template" to a unique description.

For each additonal OAuthProvider, use the new base path value to replace the `/mfpProvider` value.
