

Java HTTP Adapter

Overview

Java adapters provide free reign over connectivity to your backend. It is therefore your responsibility to ensure best practices regarding performance and other implementation details.

This tutorial covers an example of a Java adapter that connects to an RSS feed by using a Java `HttpClient`.

Prerequisite: Make sure to read the [Java Adapters \(../\)](#) tutorial first.

RSSAdapterApplication

`RSSAdapterApplication` extends `MFPJAXRSApplication` and is a good place to trigger any initialization required by your application.

```
@Override
protected void init() throws Exception {
    RSSAdapterResource.init();
    logger.info("Adapter initialized!");
}
```

RSSAdapterResource

`RSSAdapterResource` is where we handle the requests to your adapter.

```
@Path("/")
public class RSSAdapterResource {
}
```

`@Path("/")` means that the resources will be available at the URL `http(s)://host:port/ProjectName/adapters/AdapterName/`.

HTTP Client

RSSAdapterResource

```
private static CloseableHttpClient client;
private static HttpHost host;

public static void init() {
    client = HttpClients.createDefault();
    host = new HttpHost("developer.ibm.com");
}
```

Because every request to your resource will create a new instance of `RSSAdapterResource`, it is important to reuse objects that may impact performance. In this example we made the `Http` client a `static` object and initialized it in a `static init()` method, which gets called by the `init()` of `RSSAdapterApplication` as described above.

Procedure resource

RSSAdapterResource

```
@GET
@Produces("application/json")
public void get(@Context HttpServletResponse response, @QueryParam("tag") String tag)
    throws ClientProtocolException, IOException, IllegalStateException, SAXException {
    if(tag!=null && !tag.isEmpty()){
        execute(new HttpGet("/mobilefirstplatform/tag/"+ tag +"/feed"), response);
    }
    else{
        execute(new HttpGet("/mobilefirstplatform/feed"), response);
    }
}
```

Our adapter exposes just one resource URL which allows to retrieve the RSS feed from the backend service.

- @GET means that this procedure only responds to HTTP GET requests.
- @Produces("application/json") specifies the Content Type of the response to send back. We chose to send the response as a JSON object to make it easier on the client-side.
- @Context HttpServletResponse response will be used to write to the response output stream. This enables us more granularity than returning a simple string.
- @QueryParam("tag") String tag enables the procedure to receive a parameter. The choice of QueryParam means the parameter is to be passed in the query (/RSSAdapter/?tag=MobileFirst_Platform). Other options include @PathParam, @HeaderParam, @CookieParam, @FormParam, etc.
- throws ClientProtocolException, ... means we are forwarding any exception back to the client. The client code is responsible for handling potential exceptions which will be received as HTTP 500 errors. Another solution (more likely in production code) is to handle exceptions in your server Java code and decide what to send to the client based on the exact error.
- execute(new HttpGet("/mobilefirstplatform/feed"), response). The actual HTTP request to the backend service is handled by another method defined later.

Depending if you pass a tag parameter, execute will retrieve a different build a different path and retrieve a different RSS file.

execute()

RSSAdapterResource

```

public void execute(HttpUriRequest req, HttpServletResponse resultResponse)
    throws ClientProtocolException, IOException,
        IllegalStateException, SAXException {
    HttpResponse RSSResponse = client.execute(host, req);
    ServletOutputStream os = resultResponse.getOutputStream();
    if (RSSResponse.getStatusLine().getStatusCode() == HttpStatus.SC_OK){
        resultResponse.addHeader("Content-Type", "application/json");
        String json = XML.toJson(RSSResponse.getEntity().getContent());
        os.write(json.getBytes(Charset.forName("UTF-8")));

    }else{
        resultResponse.setStatus(RSSResponse.getStatusLine().getStatusCode());
        RSSResponse.getEntity().getContent().close();
        os.write(RSSResponse.getStatusLine().getReasonPhrase().getBytes());
    }
    os.flush();
    os.close();
}

```

- `HttpResponse RSSResponse = client.execute(host, req)`. We use our static HTTP client to execute the HTTP request and store the response.
- `ServletOutputStream os = resultResponse.getOutputStream()`. This is the output stream to write a response to the client.
- `resultResponse.addHeader("Content-Type", "application/json")`. As mentioned before, we chose to send the response as JSON.
- `String json = XML.toJson(RSSResponse.getEntity().getContent())`. We used `org.apache.wink.json4j.utils.XML` to convert the XML RSS to a JSON string.
- `os.write(json.getBytes(Charset.forName("UTF-8")))` the resulting JSON string is written to the output stream.

The output stream is then flushed and closed.

If `RSSResponse` is not 200 OK, we write the status code and reason in the response instead.

Results

The adapter should return the RSS feed converted to JSON.

```

{

Now, add MQA binding project reference in our Xamarin android app. Note: Both your binding project and Xamarin.Android project should be of same target framework. You can verify this by right clicking on your project -> Options -> General.</p><n<div id="attachment_83" style="width: 270px" class="wp-caption aligncenter"><p class="wp-caption-text">Xamarin Android project with added reference to MQA</p></div><n<p>Now, let's start MQA android session in our Count.Android app. Before doing this, we should create a MQA service on IBM Bluemix. You can follow the instructions mentioned at Getting started with Mobile Quality Assurance- Bluemix or watch this video.</p><n<p><iframe class='youtube-player' type='text/html' width='980' height='582' src='https://www.youtube.com/embed/zHRfGatcKPM?version=3&rel=1&fs=1&showsearch=0&showinfo=1&iv_load_policy=1&wmode=transparent' frameborder='0' allowfullscreen='true'></iframe></p><n<p>Starting a

an class="ph">Mobile Quality AssuranceÂ session with the Android SDK entails three steps. First, build a configuration to define howÂ Mobile Quality AssuranceÂ works with your app. Second, start the session itself. Third, add tracking to your activities. Open MainActivity.cs file (Android Project) and paste the code provided below</p>

```

using System;
using Android.App;
using Android.Content;
using Android.Runtime;
using Android.Views;
using Android.Widget;
using Android.OS;
using Com.Ibm.Mqa.Config;
using Com.Ibm.Mqa;
using namespace Count.Android;
[Activity (Label = "Count.Android", MainLauncher = true, Icon = @drawable/icon)]
public class MainActivity : Activity
{
    int count = 1;
    Use your own generated APP KEY
    const string APP_KEY = "lg59b7d884f9fdf5426162e5cb1f87a700648bce4fg0glg379e0d3a";
    protected override void onCreate (Bundle bundle)
    {
        base.OnCreate (bundle);
        MQA Android session configuration
        Configuration configuration = new Configuration.Builder(this)
            .WithAPIKey(APP_KEY)
            .Provides the quality assurance application APP_KEY
            .WithMode(MQA.Mode.Qa)
            .Selects the quality assurance application mode
            .WithReportOnShakeEnabled(true)
            .Enables shake report trigger
            .WithDefaultUser("default_user@email.com")
            .Sets a default user and user selection
            .Build();
        Starting MQA Android Session
        MQA.StartNewSession (this, configuration);
        Set our view from the "main" layout resource
        setContentView (Resource.Layout.Main);
        Get our button from the layout resource, and attach an event to it
        Button button = FindViewById<Button> (Resource.Id.myButton);
        button.Click += delegate {
            button.Text = string.Format ("{0} clicks!", count++);
        };
    }
}

```

Now, MQA is integrated into Xamarin.Android app and we are good to go.</p>
 What we have implemented above is just a drop in the Ocean of MQA, to know more about MQA and its features – VisitÂ MQA Knowledge Centre</p>
 Happy Coding !!!</p>

n@in.ibm.com) and Vittal Pai (vittalpai@in.ibm.com)</p><p>With the release o
f MobileFirst Platform v7.1, one can now migrate any existing iOS app built for
MobileServices on Bluemix to MobileFirst Platform with just a handful of simple
steps.</p><p>To elucidate the process, lets look at how to migrate a simple
Bluemix iOS app.</p><p>To migrate an existing iOS app built for MobileService
s on Bluemix to run on MobileFirst Platform, follow the steps below.</p>Existing Bluemix Server ApplicationExisting Bluemix Client ApplicationMigration of Client ApplicationMigration of JAX-RS Application to JAVA AdapterConfiguring Custom-0AuthConfiguring Push CapabilitySample and Source Code<h2 id=\"migrateexisting\">Existing Bluemix Server Application</h2><p>The Bluemix app has the followi
ng functionality:</p>On the client side, the application stores a
list of items and provides a way to add more items to the list. Each item can ab
le to store Name, Store, Price and image of the product. The App's are pro
tected by Custom Authenticator via AMA security service provided by bluemix.On the server side, the App contains a JAX-RS class to store and manipu
late the data. It also contains the server side AMA security implementation.<p>On BlueMix we have application with the following configuration:</p>Liberty Runtime : which used to run JAX-RS application on Blue
mixAdvance Mobile Access service : which gives mobile application s
ecurity and monitoring functionalityPush Service for iOS 8 : which
provides the capability to use iOS Push features<h3> Liberty Ru
ntime </h3>Liberty contains two projects with JAX-RS service (i.e
Custom-oauth-java for Custom Authentication and LocalstoreAdapter for storing i
tems). The service include the protected resource and the custom identity provi
der code. The liberty server is configured with TAI.Trust Associa
tion Interface (TAI) is a service provider API that enables the integration of
third-party security services with a Liberty profile server. For more info on T
AI : <a href=\"http://www-01.ibm.com/support/knowledgecenter/was_beta_libe
rty/com.ibm.websphere.wlp.nd.multipatform.doc/ae/twlp_dev_custom_tai.html\"
target=\"_blank\">click hereThe custom identity provider aut
henticates a user by sending challenges to the client. However, custom identity
providers do not communicate directly with clients. They send challenges and rec
eive responses to the challenges by means of the Advanced Mobile Access service.
When a custom identity provider successfully authenticates the user, it provides
the user identity information to Advanced Mobile Access. For more information on
custom authentication refer bluemix documentation : <a href=\"https://www.ng.
bluemix.net/docs/services/mobileaccess/security/id_provs/index-gentopic2.
html#custom_id_prov\" target=\"_blank\">click here<p>The custom identity
provider code is defined by two http API:</p><pre class=\"brush: plain; titl
e: ; nottranslate\">\\startAutorization</pre><p> and</p><pre class=\"brush: pla
in; title: ; nottranslate\">\\handleChallengeAnswer</pre><pre class=\"brush:
java; title: ; nottranslate\"> @POST\\n\\t@Consumes ("application\\json"
)\\n\\t@Path("\\{tenantId}\\customAuthRealm 3\\startAuthorization")\\n\\t

[illegible]

```

    } catch (IOException | InterruptedException | InterruptedException) {
        // ...
    }
    System.out.println("Size : " + props.size());
    URL url = this.getClass().getClassLoader().getResource("data.properties");
    File file = new File(url.toURI().getPath());
    FileOutputStream foStream = new FileOutputStream(file);
    props.store(foStream, "clearing all data");
    foStream.close();
    return "cleared";
}

```

Add TAI Extension in the following path of server directory
 server\usr\extensions
 TAI Extension Link : Download the extension.zip from [here](https://hub.jazz.net/project/chethan/parkstore-bluemix-server/overview)

Add TAI Security constraint in web.xml file for both the projects.

```

<security-constraint>
    <web-resource-collection>
        <web-resource-name>LocalstoreApplication</web-resource-name>
        <url-pattern>/apps/*</url-pattern>
        <web-resource-collection>
            <auth-constraint>
                <role-name>TAIUserRole</role-name>
            </auth-constraint>
            <security-role id="SecurityRole_TAIUserRole" >
                <role-name>TAIUserRole</role-name>
            </security-role>
        </pre>

```

Add OAuthTai feature in server.xml

```

<feature>usr:OAuthTai-1.0</feature>

```

Protect the Urls using TAI by adding following code in server.xml

```

<usr:OAuthTAI id="myOAuthTAI" realmName="imfRealm">
    <securityConstraint httpMethods="GET, POST" securedURLs="/LocalstoreAdapter/*" />
    <securityConstraint httpMethods="GET, POST" securedURLs="/custom-oauth-java/*" />
    <usr:OAuthTAI>
        <webApplication id="custom-oauth-java" location="custom-oauth-java.war" name="custom-oauth-java" />
        <application-bnd>
            <security-role name="TAIUserRole" />
            <special-subject type="ALL_AUTHENTICATED_USERS" />
            </security-role>
            </application-bnd>
            </webApplication>
        <webApplication id="LocalstoreAdapter" location="LocalstoreAdapter.war" name="LocalstoreAdapter" />
        <application-bnd>
            <security-role name="TAIUserRole" />
            <special-subject type="ALL_AUTHENTICATED_USERS" />
            </security-role>
            </application-bnd>
            </webApplication>
        </pre>

```

Specify the IMF Auth Url inside Server.env file in liberty.

```

imfServiceUrl=https://imf-authserver.ng.bluemix.net/imf-authserver

```

Create a server package which contains above two applications using following command.

```

./server package ${server_name} --include=usr

```

Push the newly created server package to Bluemix using following command.

```

cf push ${app_name} -p ${path_to_server_package_zip}

```

Advance Mobile Access service

Bind the pushed application to Advance Mobile Access Service.
 [!\[\]\(a3ea015cc5581cad732d1eb81613fe7b_img.jpg\)](https://developer.ibm.com/mobilefirstplatform/wp-content/uploads/sites/32/2015/07/Screenshot-2015-07-17-at-3.28.04-pm.png)

Register your client application in AMA dashboard. For more info refer documentation : [click here](https://www.ng.bluemix.net/docs/services/mobileaccess/index.html)

[!\[\]\(b4746ffbe3ffe6750d2dbafa2ea7d9e5_img.jpg\)](https://developer.ibm.com/mobilefirstplatform/wp-content/uploads/sites/32/2015/07/Screenshot-2015-07-17-at-3.42.32-pm.png)

1/-at-3.42.32-pm.png\" alt=\"AMA Client Registration\" width=\"935\" height=\"452\" class=\"alignnone size-full wp-image-14883\" \"/>\n\n AMA provides Facebook, Google, or a custom identity provider to authenticate access to protected resources. Add Custom identity provider feature as it can be migrated to MFPP and specify the corresponding jax-rs custom authentication application url and realm name.
\n\n\n Add the following code inside didFinishLaunchingWithOptions function in AppDelegate of client application which will register the realm and initialize connection with Bluemix Application.\n

```

gs(tags, completionHandler: { (response:IMFResponse!, err:NSError!) -> Void in
    if err != nil {
        println("There was an error while subscribing to tag");
    } else {
        println("Successfully subscribe to tag parkstore");
    }
})

```

>Add the following function inside AppDelegate which triggers when push notification arrived in client app.

```

```

func application(application: UIApplication, didReceiveRemoteNotification userInfo: [NSObject : AnyObject]) {
 println("Got remote Notification. Data : \\"(userInfo.description)"");
 let info = userInfo as NSDictionary
 let data = info.objectForKey("aps")?.objectForKey("alert") as! NSDictionary
 let userData = data.objectForKey("body") as! String
 let alertView = UIAlertView(title: "WishList!", message: "\\"(userData)", delegate: nil, cancelButtonTitle: "OK");
 alertView.show();
}

```

```

Existing Bluemix Client Application

Add the following Code snippets to the existing Bluemix Client Application and name the application with same name which you have registered in Advance Mobile Access Dashboard.

- Add the following code inside didFinishLaunchingWithOptions function in AppDelegate of client application which will register the realm and initialize connection with Bluemix Application.

```

```

IMFClient.sharedInstance().registerAuthenticationDelegate(customAuthDelegate, forRealm: "customAuthRealm_3");
IMFClient.sharedInstance().initializeWithBackendRoute("https://parkstore.mybluemix.net", backendGUID: "5e3ad88d-dd48-469d-b46f-2c4ad66b5345");

```

```

The following is the sample code to invoke the Rest url in client application.

```

```

var request: IMFResourceRequest = IMFResourceRequest(path: "https://parkstore.mybluemix.net/LocalstoreAdapter/apps/5e3ad88d-dd48-469d-b46f-2c4ad66b5345/localstore/getAllItems", method: "GET");
request.sendWithCompletionHandler { (wResponse:IMFResponse!, err:NSError!) -> Void in
}

```

```

Add the following code inside didFinishLaunchingWithOptions function in AppDelegate of client application which will register notifications in client app.

```

```

let notificationTypes: UIUserNotificationType = UIUserNotificationType.Badge | UIUserNotificationType.Alert | UIUserNotificationType.Sound
let notificationSettings: UIUserNotificationSettings = UIUserNotificationSettings(forTypes: notificationTypes, categories: nil)
application.registerUserNotificationSettings(notificationSettings)
application.registerForRemoteNotifications()

```

```

Add the following code inside didRegisterForRemoteNotificationsWithDeviceToken function in AppDelegate of client application which will register pushclient and subscribe to tag in client app.

```

```

IMFPushClient.sharedInstance().registerDeviceToken(deviceToken, completionHandler: { (response, error) -> Void in
 if error != nil {
 println("Error during device registration \\"(error.description)"");
 } else {
 println("Response during device registration json: \\"(response.responseJson.description)"");
 var tags = ["parkstore"];
 IMFPushClient.sharedInstance().subscribeToTags(tags, completionHandler: { (response:IMFResponse!, err:NSError!) -> Void in
 if err != nil {
 println("There was an error while subscribing to tag");
 } else {
 println("Successfully subscribe to tag parkstore");
 }
 })
 }
}

```

```

Add the following function inside AppDelegate which triggers when push notification arrived in client app.

```

```

func application(application: UIApplication, didReceiveRemoteNotification userInfo: [NSObject : AnyObject]) {
 p

```

```

```

println(&quot;Got remote Notification. Data : \\(userInfo.description)&quot;)\n
let info = userInfo as NSDictionary\n          let data = info.objectForKey(&quot;
;aps&quot;)?&quot;.objectForKey(&quot;alert&quot;) as! NSDictionary\n          let user
Data = data.objectForKey(&quot;body&quot;) as! String\n          let alertView =
UIAlertView(title: &quot;WishList!&quot;, message: &quot;\\(userData)&quot;, de
legate: nil, cancelButtonTitle: &quot;OK&quot;)\n          alertView.show()\n
}\n}</pre>\n</li>\n<li>The following are the screenshots of client applicatio
n.<br />\n<a href=\"https://developer.ibm.com/mobilefirstplatform/wp-conte

li>\n</ul>\n<h2>Migration to On-Prem</h2>\n<h3 id=\"configureclient\">Migration
of Client Application</h3>\n<p>Migration of Client Application includes foll
owing two steps</p>\n<li>Configuring Cocoapods</li>\n<li>Client App Migration
</li>\n<h3 id=\"cocoapods\">Configuring Cocoapods</h3>\n<p>If CocoaPods has n
ot been installed on a specific computer:</p>\n<ul>\n<li>Follow the &#8220;Get
ting Started&#8221; guide for CocoaPods installation: http://guides.cocoapods.
org/using/getting-started.html</li>\n<li>Open &#8220;Terminal&#8221; at the
installation location and run the &#8220;pod init&#8221; command</li>\n</ul>\n
<p>The following steps assume that the client application is working with Coco
Pods. If not, follow this &#8220;Using CocoaPods&#8221; documentation : <a href
=\"http://guides.cocoapods.org/using/using-cocoapods.html\" target=\"_blank
\">click here</a></p>\n<p>In both cases, the instructions below explain how t
o edit the &#8220;Podfile&#8221; file.</p>\n<ol>\n<li>Open the &#8220;Podfile&
#8221; file located in the root of your XCode project in a favourite text edito
r.</li>\n<li>Comment out or remove the existing content.</li>\n<li>Add the fol
lowing lines:<pre class=\"brush: plain; title: ; notranslate\">source 'https:
//github.rtp.raleigh.ibm.com/imflocalsdks/imf-client-sdk-specs.git'\npod 'I
MFCompatibility'</pre>\n</li>\n<li>Open &#8220;Terminal&#8221; at the location
of &#8220;Podfile&#8221;.</li>\n<li>Verify that the XCode project is closed.<
/li>\n<li>Run the &#8220;pod install&#8221; command.</li>\n</ol>\n<p>Open the
[MyProject].xcworkspace file in XCode. This file is located side by side with [M
yProject].xcodeproj.<br />\nAn usual CocoaPods-based project is managed as a w
orkspace containing the application (the executable) and the library (all proje
ct dependencies brought by the CocoaPods manager).</p>\n<p>In Xcode&#8217;s Bu
ild Settings, search for &#8220;Other Linker Flags&#8221; and insert ${inherite
d} (if -ObjC is defined in this field, you can just delete it, since it is confi
gured in the CocoaPod project).</p>\n<h3>Client App Migration</h3>\n<ol>\n<li>
Search for bluemix dependency imports like\n<pre class=\"brush: plain; title: :

```

```

search for <code>IMFClient</code> dependency, import <code>IMFClient</code> in the <code>IMFClient</code> class.
</pre>
</li>
<li>Look for a call to the <code>IMFClient.initializeWithBackendRoute</code> method and replace the route URL with your on-premise server URL. For example:
<pre>IMFClient.sharedInstance().initializeWithBackendRoute("https://parkstore.mybluemix.net";, backendGUID: "5e3ad88d-dd48-469d-b46f-2c4ad66b5345");</pre>
should be replaced with your on-premise MFP server URL:
<pre>IMFClient.sharedInstance().initializeWithBackendRoute("http://localhost:10080/ParkStoreMFP";, backendGUID: "5e3ad88d-dd48-469d-b46f-2c4ad66b5345");</pre>
Note, that backendGUID parameter is ignored and can be empty. Look for all instantiations of <code>IMFResourceRequest</code> class and update it.
<li>Look for all instantiations of <code>IMFResourceRequest</code> class and update the request URL with absolute or relative path to the resource. For example:
<pre>var request: IMFResourceRequest = IMFResourceRequest(path: "https://parkstore.mybluemix.net/LocalstoreAdapter/apps/5e3ad88d-dd48-469d-b46f-2c4ad66b5345/localstore/getAllItems";, method: "GET");</pre>
should be replaced with:
<pre>var request: IMFResourceRequest = IMFResourceRequest(path: "http://localhost:10080/ParkStoreMFP/adapters/LocalstoreAdapter/localstore/getAllItems";, method: "GET");</pre>
</li>
<li>Add the following code inside <code>didRegisterForRemoteNotificationsWithDeviceToken</code> function in <code>AppDelegate</code> of Client application.
<pre>WLPush.sharedInstance().tokenFromClient = deviceToken.description</pre>
</li>
<li>All on-premise applications require the <code>sample.worklight.plist</code> file to be present in the application resources. In the <code>IBMMobileFirstPlatformFoundationNativeSDK</code> pod we supply a file named <code>sample.worklight.plist</code>.
<ul>
<li>Locate the <code>sample.worklight.plist</code> file in the <code>IBMMobileFirstPlatformFoundationNativeSDK</code> pod.
<li>Copy this file to the parent (application) project and rename it to <code>worklight.plist</code>.
<li>Edit the <code>worklight.plist</code> file by setting the <code>application id</code> key to the name of your application deployed to the on-premise MFPF server.
</ul>
</li>
<li>Migration of JAX-RS Application to JAVA Adapter
<ol>
<li>To migrate JAX-RS application to on-prem (MobileFirst Foundation) server we need to do the following steps for server:
<p>Create MobileFirst Project > Create native API app for iOS
<a href="https://developer.ibm.com/mobilefirstplatform/wp-content/uploads/sites/32/2015/07/Screen-Shot-2015-07-12-at-6.50.04-pm.png"><img alt="Screen Shot 2015-07-12 at 6.50.04 pm" width="595" height="596" class="alignnone size-full wp-image-14817" /></a>
<a href="https://developer.ibm.com/mobilefirstplatform/wp-content/uploads/sites/32/2015/07/Screen-Shot-2015-07-12-at-6.51.13-pm.png"><img alt="Screen Shot 2015-07-12 at 6.51.13 pm" width="598" height="590" class="alignnone size-full wp-image-14818" /></a>
<a href="https://developer.ibm.com/mobilefirstplatform/wp-content/uploads/sites/32/2015/07/Screen-Shot-2015-07-12-at-6.52.28-pm.png"><img alt="Screen Shot 2015-07-12 at 6.52.28 pm" width="717" height="424" class="alignnone size-full wp-image-14819" /></a>
</li>
<li>Add two adapters for Custom Authentication and Localstore and migrate the JAX-RS code as shown in the following example:
</li>
</ol>
</li>
</ul>

```

Copy the JAX-RS Bluemix code and paste it in the newly created Localstore Java adapter JAX-RS file.

Add and remove the following changes in your adapter code.

- remove `\/{tenantId}\/
\code>`
- remove the `@PathParam -> PathParam(\"tenantId\")` String `deviceId` and `@PathParam(\"realmName\")` String `realmName`
- Add scope to the all http api resource `@OAuthSecurity (scope=\"customAuthRealm_3\")`

The code looks like the following

```
brush: plain; title: ; notranslate\">\n\t@GET\n\t@OAuthSecurity (scope=&quot;customAuthRealm_3&quot;)\n\t@Path(&quot;\/getAllItems&quot;)\n\tpublic String getAllItems() throws MissingConfigurationException{\n\t\t\tinit();\n\t\t\tJSONArray jsonArray = new JSONArray();\n\t\t\tfor(Object key : props.keySet()){ \n\t\t\t\tjsonArray.add(parser.parse(props.getProperty((String)key)).getAsJsonObject());\n\t\t\t}\n\t\t\treturn jsonArray.toString();\n\t}\n\n\t@PUT\n\t@OAuthSecurity (scope=&quot;customAuthRealm_3&quot;)\n\t@Path(&quot;\/addItem&quot;)\n\tpublic void addItem(String itemJson) \n\t\t\tthrows MissingConfigurationException, URISyntaxException, IOException{\n\t\t\ttry{\n\t\t\t\t\tinit();\n\t\t\t\t\tint newKey = props.keySet().size()+1;\n\t\t\t\t\tprops.put(String.valueOf(newKey), itemJson);\n\t\t\t\t\tURL url = this.getClass().getClassLoader().getResource(&quot;data.properties&quot;); \n\t\t\t\t\tFile file = new File(url.toURI().getPath());\n\t\t\t\t\tFileOutputStream foStream = new FileOutputStream(file);\n\t\t\t\t\tprops.store(foStream, &quot;saving new item&quot;);\n\t\t\t\t\tfoStream.close();\n\t\t\t\t} catch(IOException ioe){\n\t\t\t\t\tioe.printStackTrace();\n\t\t\t\t}\n\t\t}\n\n\t@POST\n\t@OAuthSecurity (scope=&quot;customAuthRealm_3&quot;)\n\t@Path(&quot;\/addAllItems&quot;)\n\tpublic String addAllItems(String itemsJson) \n\t\t\tthrows MissingConfigurationException, URISyntaxException, IOException{\n\t\t\ttry{\n\t\t\t\t\tinit();\n\t\t\t\t\tclearAllData();\n\t\t\t\t\tJSONArray jsonArr = parser.parse(itemsJson).getAsJSONArray();\n\t\t\t\t\tfor(int i=0;i<jsonArr.size();i++){ \n\t\t\t\t\t\tprops.put(String.valueOf(i+1), jsonArr.get(i).toString());\n\t\t\t\t\t}\n\t\t\t\t\tURL url = this.getClass().getClassLoader().getResource(&quot;data.properties&quot;); \n\t\t\t\t\tFile file = new File(url.toURI().getPath());\n\t\t\t\t\tFileOutputStream foStream = new FileOutputStream(file);\n\t\t\t\t\tprops.store(foStream, &quot;saving new item&quot;);\n\t\t\t\t\tfoStream.close();\n\t\t\t\t\treturn &quot;true&quot;;\n\t\t\t\t} catch(IOException ioe){\n\t\t\t\t\tioe.printStackTrace();\n\t\t\t\t}\n\t\t\treturn &quot>false&quot;;\n\t}\n\n\t@DELETE\n\t@OAuthSecurity(enabled=false)\n\t@Path(&quot;\/clearAll&quot;)\n\tpublic String clearAllData() \n\t\t\tthrows MissingConfigurationException, URISyntaxException, IOException{\n\t\t\t\tinit();\n\t\t\t\tprops.clear();\n\t\t\t\tSystem.out.println(&quot;Size : &quot;+props.size());\n\t\t\t\tURL url = this.getClass().getClassLoader().getResource(&quot;data.properties&quot;); \n\t\t\t\tFile file = new File(url.toURI().getPath());\n\t\t\t\tFileOutputStream foStream = new FileOutputStream(file);\n\t\t\t\tprops.store(foStream, &quot;clearing all data&quot;);\n\t\t\t\tfoStream.close();\n\t\t\t\treturn &quot;cleared&quot;;\n\t\t}\n}
```

Configuring Custom-0Auth

- Add realm with same name you had on BlueMix and login module to the authenticationConfig.xml.

```
brush: xml; title: ; notranslate\"><?xml version='1.0' encoding='UTF-8' ?>\n<authenticationConfig>\n    <realm name=&quot;customAuthRealm_3&quot; loginModule=&quot;customAuthLoginModule_3&quot; className=com.worklight.core.auth.ext.CustomIdentityAuthenticator parameter name=&quot;providerUrl&quot; value=&quot;http:\/\/localhost:10080\/ParkStoreMFP\/adapters\/Customauth&quot;\/>\n    <loginModule name=&quot;customAuthLoginModule_3&quot; expirationInSeconds=&quot;3600&quot; className=com.worklight.core.auth.ext.CustomIdentityLoginModule\/>\n</authenticationConfig>
```

Add Custom-oauth Realm in userIdentityRealms in Application Descriptor file of iOS Native API

```
brush: xml; title: ; notranslate\"><?xml version='1.0' encoding='UTF-8' ?>\n<applicationDescriptor>\n    <userIdentityRealms>\n        <realm name=&quot;customAuthRealm_3&quot; loginModule=&quot;customAuthLoginModule_3&quot; className=com.worklight.core.auth.ext.CustomIdentityAuthenticator parameter name=&quot;providerUrl&quot; value=&quot;http:\/\/localhost:10080\/ParkStoreMFP\/adapters\/Customauth&quot;\/>\n    </userIdentityRealms>\n</applicationDescriptor>
```

Configuring Push Capability

- Add apns p12 certificate which is generated from Apple Developer Account under iOS Native API Folder

href="//developer.ibm.com/mobilefirstplatform/wp-content/uploads/sites/32/2015/07/Screen-Shot-2015-07-12-at-6.58.03-pm.png">\n\n Add Push configuration in Application Descriptor file of iOS Native API and include the password of added apns certificate.\n<pre class="brush: xml; title: ; notranslate"><pushSender password="password">\n<tags>\n <tag>\n <name>parkstore</name>\n </tag>\n</tags></pre>\n\n Create HTTP Push Adapter with following function code which will send the user push notification to the devices which is subscribed to tag “parkstore”.\n<pre class="brush: xml; title: ; notranslate">function sendTagNotification(notificationText) {\n var notificationOptions = {};\n notificationOptions.message = {};\n notificationOptions.target = {};\n\n notificationOptions.message.alert = notificationText;\n notificationOptions.target.tagNames = ["parkstore"];\n\n WL.Server.sendMessage("ParkStoreMFP", notificationOptions);\n\n return {\n result : "Notification sent to users subscribed to the tag parkstore.";\n };\n}</pre>\n\n\n<p>By performing above steps one can easily run iOS app built for Bluemix on MobileFirst Platform and following are the links to samples.</p>\n<h3 id="sample">Sample and Source Code</h3>\n<p>Bluemix Server : Parkstore bluemix server
\nBluemix Client : Parkstore bluemix
\nMFP Server : Parkstore mfp server
\nMFP Client : Parkstore mfp</p>\n<p>The post Try on Bluemix and migrate to on-prem MobileFirst Platform appeared first on IBM MobileFirst Platform.</p>
