

# Implementing the challenge handler in Windows 8.1 Universal and Windows 10 UWP applications

## Overview

When trying to access a protected resource, the server (the security check) will send back to the client a list containing one or more **challenges** for the client to handle.

This list is received as a `JSON` object, listing the security check name with an optional `JSON` of additional data:

```
{
  "challenges": {
    "SomeSecurityCheck1": null,
    "SomeSecurityCheck2": {
      "some property": "some value"
    }
  }
}
```

The client should then register a **challenge handler** for each security check.

The challenge handler defines the client-side behavior that is specific to the security check.

## Creating the challenge handler

A challenge handler is a class responsible for handling challenges sent by the MobileFirst server, such as displaying a login screen, collecting credentials and submitting them back to the security check.

In this example, the security check is `PinCodeAttempts` which was defined in `Implementing the CredentialsValidationSecurityCheck (./security-check)`. The challenge sent by this security check contains the number of remaining attempts to login (`remainingAttempts`), and an optional `errorMsg`.

Create a C# class that extends `Worklight.ChallengeHandler`:

```
public class PinCodeChallengeHandler : Worklight.ChallengeHandler
{
}
```

## Handling the challenge

The minimum requirement from the `ChallengeHandler` class is to implement a constructor and a `HandleChallenge` method, that is responsible for asking the user to provide the credentials. The `HandleChallenge` method receives the challenge as a `WorklightResponse`.

Learn more about the `ChallengeHandler` class in the user documentation.

Add a constructor method:

```
public PinCodeChallengeHandler(String securityCheck) {
    this.securityCheck = securityCheck;
}
```

In this `HandleChallenge` example, an alert is displayed asking to enter the PIN code:

```
public override void HandleChallenge(WorklightResponse challenge)
{
    try
    {
        if(challenge.ResponseJSON["errorMsg"]!=null && challenge.ResponseJSON["errorMsg"].Type == JToken.Null)
        {
            showChallenge("This data requires a PIN code.\nRemaining attempts: " + challenge.ResponseJSON["remainingAttempts"]);
            shouldsubmitchallenge = true;
        }
        else
        {
            showChallenge(challenge.ResponseJSON["errorMsg"] +
                \nRemaining attempts: " + challenge.ResponseJSON["remainingAttempts"]);
        }
    } catch (Exception e)
    {
        Debug.WriteLine(e.StackTrace);
    }
}
```

The implementation of `showChallenge` is included in the sample application.

If the credentials are incorrect, you can expect the framework to call `HandleChallenge` again.

## Submitting the challenge's answer

Once the credentials have been collected from the UI, use the `ChallengeHandler`'s `ShouldSubmitChallengeAnswer()` and `GetChallengeAnswer()` method to send an answer back to the security check. `ShouldSubmitChallengeAnswer()` returns a boolean indicating if the challenge response should be sent back to the security check. In this example `PinCodeAttempts` expects a property called `pin` containing the submitted PIN code:

```
public override bool ShouldSubmitChallengeAnswer()
{
    JObject pinJSON = new JObject();
    pinJSON.Add("pin", pinCodeTxt.Text);
    this.challengeAnswer = pinJSON;
    return this.shouldsubmitchallenge;
}

public override JObject GetChallengeAnswer()
{
    return this.challengeAnswer;
}
```

## Cancelling the challenge

In some cases, such as clicking a "Cancel" button in the UI, you want to tell the framework to discard this challenge completely.

To achieve this, override `ShouldSubmitFailure` and `GetSubmitFailureResponse` methods:

```
public override bool ShouldSubmitFailure()
{
    return shouldsubmitfailure;
}
public override WorklightResponse GetSubmitFailureResponse()
{
    return new WorklightResponse(false, "User cancelled" , new JObject (), "",(int) HttpStatusCode.InternalServerError);
}
```

## Handling failures

Not Yet implemented

## Handling successes

## Registering the challenge handler

In order for the challenge handler to listen for the right challenges, you must tell the framework to associate the challenge handler with a specific security check name.

This is done by initializing the challenge handler with the security check like this:

```
PinCodeChallengeHandler pinCodeChallengeHandler = new PinCodeChallengeHandler("PinCodeAttempts");
```

You must then **register** the challenge handler instance:

```
IWorklightClient client = WorklightClient.CreateInstance();
client.RegisterChallengeHandler(pinCodeChallengeHandler);
```

## Sample application

The sample **PinCodeWin8** and **PinCodeWin10** are C# applications that uses `ResourceRequest` to get a bank balance.

The method is protected with a PIN code, with a maximum of 3 attempts.

Click to download (<https://github.com/MobileFirst-Platform-Developer-Center/PinCodeWin8/tree/release80>) the Windows 8 project. Click to download (<https://github.com/MobileFirst-Platform-Developer-Center/PinCodeWin10/tree/release80>) the Windows 10 UWP project.

## Sample usage

- Use either Maven or MobileFirst Developer CLI to build and deploy the available **ResourceAdapter** and **PinCodeAttempts** adapters (`../../creating-adapters/`).
- Ensure the sample is registered in the MobileFirst Server by running the command: `mfpdev app register` from a **command-line** window.

- Map the `accessRestricted` scope to the `PinCodeAttempts` security check:
  - In the MobileFirst Operations Console, under **Applications** → **PinCode** → **Security** → **Map scope elements to security checks.**, add a mapping from `accessRestricted` to `PinCodeAttempts`.
  - Alternatively, from the **Command-line**, navigate to the project's root folder and run the command: `mfpdev app push`.

Learn more about the `mfpdev app push`/`push` commands in the [Using MobileFirst Developer CLI to manage MobileFirst artifacts \(../../../../using-the-mfpf-sdk/using-mobilefirst-developer-cli-to-manage-mobilefirst-artifacts\)](#).
