

# Handling Push Notifications in Android

## Overview

In this tutorial, you will be learning how to handle push notification for Android applications.

Tag notifications are notification messages that are targeted to all the devices that are subscribed to a particular tag. Tags represent topics of interest to the user and provide the ability to receive notifications according to the chosen interest.

Broadcast notifications are a form of tag push notifications that are targeted to all subscribed devices. Broadcast notifications are enabled by default for any push-enabled MobileFirst application by a subscription to a reserved Push.all tag (auto-created for every device). Broadcast notifications can be disabled by unsubscribing from the reserved Push.all tag.

### Prerequisites:

- Android Studio and MobileFirst Developer CLI installed on the developer workstation.
- *Optional* MobileFirst Server to run locally.
- Make sure you have read the Setting up your MobileFirst development environment (./../setting-up-your-development-environment/index) tutorial.

- Handling a push notification
- Handling a secure push notification

## Notifications Configuration

1. Create a new android project via Android Studio.
2. Open the **Project Gradle** file and add the following line to the dependencies
3. Open the **App Gradle** file and add the following lines to the dependencies:

```
classpath 'com.google.gms:google-services:2.0.0-alpha3'
```

1. `com.google.android.gms:play-services-gcm:8.4.0`
2. `com.squareup.okhttp:okhttp:2.6.0`

3. Add mfp push sdk (ibmmobilefirstplatformfoundationpush) with the following compile Group:

```
compile group: 'com.ibm.mobile.foundation',
    name:'ibmmobilefirstplatformfoundationpush',
    version:'1.0.0',
    ext: 'aar',
    transitive: true
```

4. Still in the **App Gradle** file add the following line.
5. Enabling Google Services
  1. Enable Google Services (<https://developers.google.com/mobile/add?platform=android&cntapi=gcm&cnturl=https:%2F%2Fdevelopers.google.com%2Fcloud-messaging%2Fandroid%2Fclient&cntlbl=Continue%20Adding%20GCM%20Support%3Fconfigured%3Dtrue>) for your app.
  2. Add the supplied `google-services.json` to app folder
6. Add all mfp core jars (bcprov, android sync, worklight-android) to libs folder and the mfpclient.properties to assets folder
7. Copy ibmmobilefirstplatformfoundationpush-1.0.0.aar (from halpert Electra DevOps Latest integration build) to `\extras\google\m2repository\com\ibm\mobile\foundation\ibmmobilefirstplatformfoundationpush\1.0.0\ibmmobilefirstplatformfoundationpush-1.0.0.aar` Remove libs folder from the aar. Note: This step is not required once the lib gets to maven central/jcenter. Just need to add `mavenCentral()/jcenter()` in app gradle.
8. Add the push required configuration in AndroidManifest.xml (Refer to sample)
9. Use the Push SDK APIs in your application (Refer to sample)

## Notifications API

### API methods for tag notifications

- `WLPush.subscribeTag(tagName,options)` - Subscribes the device to the specified tag name.
- `WLPush.unsubscribeTag(tagName,options)` - Unsubscribes the device from the specified tag name
- `WLPush.isTagSubscribed(tagName)` - Returns whether the device is subscribed to a specified tag name

## API methods for tag and broadcast notifications

- `WLNotificationListener` - Defines the callback method to be notified when the notification arrives.
- `client.getPush().setWLNotificationListener(listener)` - This method sets the implementation class of the `WLNotificationListener` interface.
- `client.getPush().setOnReadyToSubscribeListener(listener)` - This method registers a listener to be used for push notifications. This listener should implement the `onReadyToSubscribe()` method.
- The `onMessage(props,payload)` method of `WLNotificationListener` is called when a push notification is received by the device.  
 --\* *props* – A JSON block that contains the notifications properties of the platform. --\* *payload* – A JSON block that contains other data that is sent from MobileFirst Server. The JSON block also contains the tag name for tag-based or broadcast notification. The tag name appears in the “tag” element. For broadcast notification, the default tag name is `Push.ALL`.

## Handling a push notification
