# iOS Quick Start demonstration

fork and edit tutorial (https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/7.0/quick-start/ios-quick-start.html) | report issue (https://github.ibm.com/MFPSamples/DevCenter/issues/new)

#### **Overview**

The purpose of this demonstration is to experience an end-to-end flow where the MobileFirst Platform Foundation SDK for iOS is integrated into a Xcode project and used to retrieve data using a MobileFirst adapter.

To learn more about creating projects and applications, using adapters and lots more, visit the Native iOS Development (../../ios-tutorials/) landing page.

#### Required installed:

- MobileFirst Platform commandline tool (download (file:///home/travis/build/MFPSamples/DevCenter/\_site/downloads/))
- Xcode 6.x

#### Create a MobileFirst project and adapter

o Create a new project and iOS framework/server-side application entity

```
mfp create MyProject
cd MyProject
mfp add api MyiOSFramework -e ios
```

Add a HTTP adapter to the project

mfp add adapter MyAdapter -t http

# 2. Deploy artifacts to the MobileFirst Server

o Start the MobileFirst Server and deploy the server-side application entity and adapter

```
mfp start
# Wait until a browser window is opened, displaying the MobileFirst Console
mfp build
mfp deploy
```

## 3. Create a Xcode project

## 4. Add the MobileFirst iOS SDK to the Xcode project

- In Project explorer right-click and select Add Files to your-iOS-app-name...
  - Navigate to *project-folder-location* > MyProject > apps > MyiOSFramework and

select worklight.plist file and the WorklightAPI folder

- In Build Phases open Link Binary With Libraries and add:
  - libWorklightStaticLibProjectNative.a (found in WorklightAPI)
  - sqlcipher.framework (found in WorklightAPI/Frameworks)
  - SystemConfiguration.framework
  - MobileCoreServices.framework
  - CoreLocation.framework
  - Security.framework
  - libstdc++.6.dylib
  - libc++.dylib
  - libz.dylib
- In Build Settings search for:
  - Header Search Path: add \$(SRCR00T)/WorklightAPI/include
  - Other Linker Flags: add -0bjC

### 5. Implement MobileFirst adapter invocation

• **AppDelegate.h** Add the header:

```
#import "WLResourceRequest.h"
```

• **AppDelegate.m** Add the header:

```
#import "WLResponse.h"
```

Add the following to didFinishLaunchingWithOptions:

```
- (BOOL)application:(UIApplication *)application didFinishLaunchingWithOptions:(NSDiction
ary *)launchOptions {
    NSURL* url = [NSURL URLWithString:@"/adapters/MyAdapter/getFeed"];
    WLResourceRequest* request = [WLResourceRequest requestWithURL:url method:WL
HttpMethodGet];
    [request setQueryParameterValue:@"['technology']" forName:@"params"];

[request sendWithCompletionHandler:^(WLResponse *response, NSError *error) {
    if(error != nil){
        NSLog(@"%@",error.description);
    }
    else{
        NSLog(@"%@",response.responseJSON);
    }
}];

return YES;
}
```

# 6. Final configurations

• Supply the machine's IP address for the host property in worklight.plist

### 7. Click Run

Review the Xcode console for the data retrieved by the adapter request.
