# Resource request from Cordova applications

fork and edit tutorial (https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/8.0/using-the-mfpf-sdk/resource-request-from-cordova-applications/index.md) | report issue (https://github.ibm.com/MFPSamples/DevCenter/issues/new)

#### **Overview**

MobileFirst applications can access resources using the WLResourceRequest REST API. The REST API works with all adapters and external resources.

#### Prerequisites:

- Ensure you have added the MobileFirst Platform SDK (../../adding-the-mfpf-sdk/cordova) to your Cordova application.
- Learn how to create adapters (../../adapters/adapters-overview/).

## WLResourceRequest

The WLResourceRequest class handles resource requests to adapters or external resources.

Create a WLResourceRequest object and specify the path to the resource and the HTTP method. Available methods are: WLHttpMethodGet, WLHttpMethodPost, WLHttpMethodPut and WLHttpMethodDelete.

```
var resourceRequest = new WLResourceRequest(
   "/adapters/JavaAdapter/users",
   WLResourceRequest.GET
);
```

- For **JavaScript adapters**, use /adapters/{AdapterName}/{procedureName}
- For **Java adapters**, use /adapters/{AdapterName}/{path}. The path depends on how you defined your @Path annotations in your Java code. This would also include any @PathParam you used.
- To access resources outside of the project, use the full URL as per the requirements of the external server.
- timeout: Optional, request timeout in milliseconds

# Sending the request

Request the resource by using the send() method.

The send() method takes an optional parameter to set a body to the HTTP request, which could be a JSON object or a simple string.

```
resourceRequest.send().then(
onSuccess,
onFailure
)
```

Using JavaScript **promises**, you can define onSuccess and onFailure functions.

#### setQueryParameter

By using the setQueryParameter method, you can include query (URL) parameters in the REST request.

• In JavaScript adapters, which use ordered nameless parameters, pass an array of parameters with the name params:

```
resourceRequest.setQueryParameter("params", "['param1', 'param2']");
```

• In Java adapters or external resources, use setQueryParameter for each parameter:

```
resourceRequest.setQueryParameter("param1", "value1");
resourceRequest.setQueryParameter("param2", "value2");
```

#### setHeader

By using the setHeader method, you can set a new HTTP header or replace an existing header with the same name in the REST request.

```
resourceRequest.setHeader("Header-Name","value");
```

#### sendFormParameters(json)

To send URL-encoded form parameters, use the sendFormParameters(json) method instead. This method converts the JSON to a URL encoded string, sets the content-type to application/x-www-form-urlencoded, and sets it as the HTTP body.

For more information about <u>WLResourceRequest</u>, see the API reference in the user documentation.

### The response

Both the onSuccess and onFailure callbacks receive a response object, which typically contains the following properties:

- status: The HTTP response status
- **responseJSON**: An object that contains the data that is returned by the called resource, and additional information about the resource call.

The response object is returned to the corresponding success/failure handler.

```
"errors": [],
 "info": [],
 "warnings": [],
 "isSuccessful": true,
 "responseHeaders": {
  "Cache-Control": "no-cache, must-revalidate, post-check=0, pre-check=0"
 },
 "responseTime": 491,
 "statusCode": 200,
 "statusReason": "OK",
 "totalTime": 592,
 "Items": [{
  "creator": "Jon Fingas",
  "link": "http:\/\www.engadget.com\/2014\/11\/10\/harvard-used-cameras-to-check-attendance\/?ncid=rss
truncated",
  "pubDate": "Mon, 10 Nov 2014 02:21:00 -0500",
  "title": "Harvard used cameras to track attendance without telling students"
 }]
}
```

- lerrors, info, and warnings are optional arrays of strings that contain messages.
- The isSuccessful property is set to true if the resource call succeeded (even if no data was retrieved), or to false otherwise.
- The response can contain other metadata such as responseHeaders, responseTime, statusCode, statusReason, and totalTime.

# Handling the response

The rest of the resource call result depends on what was retrieved from the back-end system. In this example, the Items element is a JSON representation of the XML code that was received from the back end, after the rules in the XSL file were applied.

```
function onSuccess(result){
  showResult(result.responseJSON);
}
```

#### For more information

For more information about WLResourceRequest, refer to the user documentation.

### Sample application

The ResourceRequestCordova project contains a Cordova application that makes a resource request using a Java adapter.

The adapter Maven project contains the Java adapter to be used during the resource request call.

Click to download (https://github.com/MobileFirst-Platform-Developer-

Center/ResourceRequestCordova/tree/release80) the Cordova project.

Click to download (https://github.com/MobileFirst-Platform-Developer-

Center/Adapters/tree/release80) the adapter Maven project.

#### Sample usage

- 1. From the command line, navigate to the project's root folder.
- 2. Ensure the sample is registered in the MobileFirst Server by running the command:

mfpdev app register.

- 3. Add a platform by running the cordova platform add command.
- 4. The sample uses the JavaAdapter contained in the Adapters Maven project.

  Use either Maven or MobileFirst Developer CLI to build and deploy the adapter (../../adapters/creating-adapters/).
- 5. To test or debug an adapter, see the testing and debugging adapters (../../adapters/testing-and-debugging-adapters) tutorial.
- 6. Run the Cordova application by running the cordova run command.
