Implementing the challenge handler in Android applications

fork and edit tutorial (https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/8.0/authentication-and-security/user-authentication/android/index.md) | report issue (https://github.ibm.com/MFPSamples/DevCenter/issues/new)

Overview

Prerequisite: Make sure to read the **CredentialsValidationSecurityCheck**'s challenge handler implementation (../../credentials-validation/android) tutorial.

The challenge handler will demonstrate a few additional features (APIs) such as the preemptive login, logout and obtainAccessToken.

Login

In this example, UserLoginSecurityCheck expects *key:value*s called username and password. Optionally, it also accepts a boolean rememberMe key that will tell the security check to remember this user for a longer period. In the sample application, this is collected using a boolean value from a checkbox in the login form.

```
credentials is a JSONObject containing username, password and rememberMe:
submitChallengeAnswer(credentials);
```

You may also want to login a user without any challenge being received. For example, showing a login screen as the first screen of the application, or showing a login screen after a logout, or a login failure. We call those scenarios **preemptive logins**.

You cannot call the submitChallengeAnswer API if there is no challenge to answer. For those scenarios, the MobileFirst Platform Foundation SDK includes the login API:

```
WLAuthorizationManager.getInstance().login(securityCheckName, credentials, new WLLoginResponseListe ner() {
    @Override
    public void onSuccess() {
        Log.d(securityCheckName, "Login Preemptive Success");
    }

@Override
    public void onFailure(WLFailResponse wlFailResponse) {
        Log.d(securityCheckName, "Login Preemptive Failure");
    }
});
```

If the credentials are wrong, the security check will send back a **challenge**.

It is the developer's responsibility to know when to use <code>login</code> vs <code>submitChallengeAnswer</code> based on the application's needs. One way to achieve this is to define a boolean flag, for example <code>isChallenged</code>, and set it to <code>true</code> when reaching <code>handleChallenge</code> or set it to <code>false</code> in any other cases (failure, success, initializing, etc).

When the user clicks the **Login** button, you can dynamically choose which API to use:

```
public void login(JSONObject credentials){
   if(isChallenged){
      submitChallengeAnswer(credentials);
   }
   else{
      WLAuthorizationManager.getInstance().login(securityCheckName, credentials, new WLLoginRespons eListener() {
   //...
     });
   }
}
```

Note: WLAuthorizationManager's login() API has its own onSuccess and onFailure methods, the relevant challenge handler's handleSuccess or handleFailure will **also** be called.

Obtaining an access token

Since this security check supports *remember me* functionality, it would be useful to check if the client is currently logged in, during the application startup.

The MobileFirst Platform Foundation SDK provides the obtainAccessToken API to ask the server for a valid token:

```
WLAuthorizationManager.getInstance().obtainAccessToken(scope, new WLAccessTokenListener() {
    @Override
    public void onSuccess(AccessToken accessToken) {
        Log.d(securityCheckName, "auto login success");
    }

@Override
    public void onFailure(WLFailResponse wlFailResponse) {
        Log.d(securityCheckName, "auto login failure");
    }
});
```

Note: WLAuthorizationManager's obtainAccessToken() API has its own onSuccess and onFailure methods, the relevant challenge handler's handleSuccess or handleFailure will **also** be called.

If the client is already logged-in or is in the *remembered* state, the API will trigger a success. If the client is not logged in, the security check will send back a challenge.

The obtainAccessToken API takes in a **scope**. The scope can be the name of your **security check**.

Learn more about **scope** in the Authorization concepts (../../authorization-concepts) tutorial

Retrieving the authenticated user

The challenge handler's handleSuccess method receives a JSONObject identity as a parameter. If the security check sets an AuthenticatedUser, this object will contain the user's properties. You can use handleSuccess to save the current user:

```
@Override
public void handleSuccess(JSONObject identity) {
    super.handleSuccess(identity);
    isChallenged = false;
    try {
        //Save the current user
        SharedPreferences preferences = context.getSharedPreferences(Constants.PREFERENCES_FILE, C
    ontext.MODE_PRIVATE);
        SharedPreferences.Editor editor = preferences.edit();
        editor.putString(Constants.PREFERENCES_KEY_USER, identity.getJSONObject("user").toString());
        editor.commit();
    } catch (JSONException e) {
        e.printStackTrace();
    }
}
```

Here, identity has a key called user which itself contains a JSONObject representing the AuthenticatedUser:

```
{
"user": {
  "id": "john",
  "displayName": "john",
  "authenticatedAt": 1455803338008,
  "authenticatedBy": "UserLogin"
}
}
```

Logout

The MobileFirst Platform Foundation SDK also provides a logout API to logout from a specific security check:

```
WLAuthorizationManager.getInstance().logout(securityCheckName, new WLLogoutResponseListener() {
    @Override
    public void onSuccess() {
        Log.d(securityCheckName, "Logout Success");
    }

@Override
    public void onFailure(WLFailResponse wlFailResponse) {
        Log.d(securityCheckName, "Logout Failure");
    }
});
```

Sample applications

There are two samples associated with this tutorial:

PreemptiveLoginAndroid: An application that always starts with a login screen, using the

preemptive login API.

• **RememberMeAndroid**: An application with a *Remember Me* checkbox. The user can bypass the login screen the next time the application is opened.

Both samples use the same UserLoginSecurityCheck from the **SecurityCheckAdapters** adapter Maven project.

Center/SecurityCheckAdapters/tree/release80) the SecurityAdapters Maven project.

Click to download (https://github.com/MobileFirst-Platform-Developer-

Center/RememberMeAndroid/tree/release80) the Remember Me project. Click to download (https://github.com/MobileFirst-Platform-Developer-Center/PreemptiveLoginAndroid/tree/release80) the Remember Me project.

Sample usage

- Use either Maven or MobileFirst Developer CLI to build and deploy the available **ResourceAdapter** and **UserLogin** adapters (../../creating-adapters/).
- Ensure the sample is registered in the MobileFirst Server by running the command: mfpdev app register from a command-line window.
- Map the accessRestricted scope to the UserLogin security check:
 - In the MobileFirst Operations Console, under Applications → [your-application] → Security
 → Map scope elements to security checks, add a mapping from accessRestricted to UserLogin.
 - Alternatively, from the **Command-line**, navigate to the project's root folder and run the command: mfpdev app push.

Learn more about the mfpdev app push/push commands in the Using MobileFirst Developer CLI to manage MobilefFirst artifacts (../../using-the-mfpf-sdk/using-mobilefirst-developer-cli-to-manage-mobilefirst-artifacts).
