# Resource Request from Native Android Applications

### **Overview**

MobileFirst applications can access resources using the WLResourceRequest REST API. The REST API works with all adapters and external resources.

**Prerequisite**: Ensure you have added the MobileFirst Platform SDK (../../adding-the-mfpf-sdk/adding-the-mfpf-sdk-to-android-applications) to your Native Android project.

# WLResourceRequest

The WLResourceRequest class handles resource requests to adapters or external resources.

1. Define the URI of the resource:

```
URI adapterPath = new URI("/adapters/RSSReader/getFeed");
```

- For JavaScript adapters, use /adapters/{AdapterName}/{procedureName}
- For Java adapters, use /adapters/{AdapterName}/{path}
- o To access resources outside of the project, use the full URL
- 2. Create a WLResourceRequest object and choose the HTTP Method (GET, POST, etc):

WLResourceRequest request = new WLResourceRequest(adapterPath,WLResourceRequest.GET);

- 3. Add the required parameters:
  - In JavaScript adapters, which use ordered nameless parameters, pass an array of parameters with the name params:

```
request.setQueryParameter("params","['param1', 'param2']");
```

• In Java adapters or external resources, use the setQueryParameter method for each parameter:

```
request.setQueryParameter("param1","value1");
request.setQueryParameter("param2","value2");
```

4. CHANGE according to the new sample Call the resource by using the .send() method. Specify a MyInvokeListener class instance:

```
request.send(new MyInvokeListener());
```

See the user documentation to learn more about WLResourceRequest and other signatures for the send method, which are not covered in this tutorial.

# The response

CHANGE according to the new sample When the resource call is completed, the framework calls one of the methods of the MyInvokeListener class.

1. CHANGE according to the new sample Specify that the MyInvokeListener class implements the WLResponseListener interface:

```
public class MyInvokeListener implements WLResponseListener {
}
```

2. Implement the onSuccess and onFailure methods.

If the resource call is successful, the onSuccess method is called. Otherwise, the onFailure method is called. Use these methods to get the data that is retrieved from the adapter.

The response object contains the response data and you can use its methods and properties to retrieve the required information.

```
public void onSuccess(WLResponse response) {
    String responseText = response.getResponseText();
    AndroidNativeApp.updateTextView("Successfully called the resource\n" + responseText);
}

public void onFailure(WLFailResponse response) {
    String responseText = response.getResponseText();
    AndroidNativeApp.updateTextView("Failed to call the resource\n" + responseText);
}
```

#### For more information

For more information about WLResourceRequest, refer to the user documentation.

# Sample application

The ResourceRequestSwift project contains a native Android application that makes a resource request using a Java adapter.

The adapter Maven project contains the Java adapter to be used during the resource request call.

Click to download (https://github.com/MobileFirst-Platform-Developer-

Center/ResourceRequestAndroid/tree/release80) the Native project.

Click to download (https://github.com/MobileFirst-Platform-Developer-Center/Adapters/tree/release80) the adapter Maven project.

### Sample usage

- Make sure to update the app/src/main/assets/mfpclient.properties file in the Android Studio project with the server properties.
- The sample uses the JavaAdapter contained in the Adapters Maven project. Use either Maven or MobileFirst Developer CLI to build and deploy the adapter (../../creating-adapters/).
