## Implementing Security Check with Attempts in iOS applications

 $for k\ and\ edit\ tutorial\ (https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/8.0/authentication-and-security/security-check-with-attempts/ios.md)\ |\ report\ issue\ (https://github.ibm.com/MFPSamples/DevCenter/issues/new)$ 

## **Overview**

When trying to access a protected resource, the server (the SecurityCheck) will send back the client one or more **challenges** for the client to handle.

This list is received as a JSON object, listing the SecurityCheck name with an optional JSON of additional data:

```
{
"challenges": {
   "SomeSecurityCheck1":null,
   "SomeSecurityCheck2":{
      "some property": "some value"
   }
}
```

The client must then register a **challenge handler** for each SecurityCheck, which will know how to handle the challenge (eg. show a login screen).

## Creating the challenge handler

A **challenge handler** is a class responsible for handling challenges sent by the MobileFirst server, such as collecting credentials and submitting them back to the SecurityCheck.

In this example, the SecurityCheck is the one defined in
