Handling Push Notifications in Cordova applications

fork and edit tutorial (https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/8.0/notifications/handling-push-notifications-in-cordova.md) | report issue (https://github.ibm.com/MFPSamples/DevCenter/issues/new)

Overview

Tag notifications are notification messages that are targeted to all the devices that are subscribed to a particular tag. Tags represent topics of interest to the user and provide the ability to receive notifications according to the chosen interest.

Broadcast notifications are a form of tag push notifications that are targeted to all subscribed devices. Broadcast notifications are enabled by default for any push-enabled MobileFirst application by a subscription to a reserved Push.all tag (auto-created for every device). Broadcast notifications can be disabled by by unsubscribing from the reserved Push.all tag.

Agenda

- Notifications Configuration
- Notifications API
- Handling a push notification
- Handling a secure push notification

Notifications Configuration

To get the application running for Android

- 1. Create cordova app using cordova create and mfp cordova template
- 2. \$ cordova platform add android
- 3. \$ cordova platform add plugin cordova-plugin-mfp-push
- 4. \$ cordova build
- 5. Import the app/platforms/android into Android Studio
- 6. In build.gradle(module:Android), add to respositories (2x)

```
maven {
    url
    "http://visustar.francelab.fr.ibm.com:8081/nexus/content/repositories/mobile-s"
}
```

- 7. In build.gradle(module:Android), add classpath 'com.google.gms:google-services:2.0.0-alpha3' to dependencies (3x)
- 8. In build.gradle(module:Android), add jcenter() to repositories in buildscript block
- 9. Add compile 'com.google.android.gms:play-services-gcm:8.4.0' to app/platforms/android/cordova-plugin-mfp-push/-build-extras.gradle in dependencies
- Add compile 'com.squareup.okhttp:okhttp:2.6.0' to app/platforms/android/cordova-plugin-mfp-push/build-extras.gradle in depedencies
- 11. Add apply plugin: 'com.google.gms.google-services' to app/platforms/android/cordova-plugin-mfp-

- push/-build-extras.gradle outside dependencies
- 12. Add google-services ison configuration file to app/platforms/android folder
- 13. Change version to '8.0.0-Beta1-SNAPSHOT' in app/platforms/android folder
- 14. Add the Push SDK APIs to your application (Refer the sample application)
- 15. If you want to change the notification title, then add push notification tile in strings.xml

To get the application running for iOS

- 1. Create Cordova project without using cordova mfp template
- 2. \$ cordova platform add ios
- 3. \$ cordova platform add plugin cordova-plugin-mfp-push
- 4. \$ cordova build
- 5. Open in XCode
- 6. Use the Push SDK APIs (Refer Sample)

Notifications API

API methods for tag notifications

Client-side API

- MFPPush.subscribeTag(tagName,options) Subscribes the device to the specified tag name.
- MFPPush.unsubscribeTag(tagName,options) Unsubscribes the device from the specified tag name.
- `MFPPush.registerDevice(options) Registers devices for push notifications (?!? confirm definition ?!?)
- MFPPush.isPushSupported() Returns true if push notifications are supported by the platform, or false otherwise.
- MFPPush.isTagSubscribed(tagName) Returns whether the device is subscribed to a specified tag name.

Common API methods for tag and broadcast notifications

Client-side API

- WL.Client.Push.onMessage (props, payload) This method is called when a push notification is received by the device.
- props A JSON block that contains the notification properties of the platform.
- payload A JSON block that contains other data that is sent from MobileFirst Server. The JSON block also contains the tag name for tag-based or broadcast notification. The tag name appears in the "tag" element. For broadcast notification, the default tag name is Push.ALL.

Handling a push notification

Handling a secure push notification
