# Handling Push Notifications in Windows 8 Universal and Windows 10 UWP applications

fork and edit tutorial (https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/8.0/notifications/handling-push-notifications-in-windows-8-10.md) | report issue (https://github.ibm.com/MFPSamples/DevCenter/issues/new) In this tutorial, you will be learning how to handle push notification for Windows 8 applications.

Tag notifications are notification messages that are targeted to all the devices that are subscribed to a particular tag. Tags represent topics of interest to the user and provide the ability to receive notifications according to the chosen interest.

Broadcast notifications are a form of tag push notifications that are targeted to all subscribed devices. Broadcast notifications are enabled by default for any push-enabled MobileFirst application by a subscription to a reserved Push.all tag (auto-created for every device). This ability can be disabled by by unsubscribing from the reserved Push.all tag.

### Agenda

- Notifications configuration
- Notifications API
- · Handling a push notification
- Handling a secure push notification

## **Notifications Configuration**

#### **Notifications API**

API methods for tag notifications

#### Client-side API

- WLPush.subscribeTag(tagName,options) Subscribes the device to the specified tag name.
- WLPush.unsubscribeTag(tagName,options) Unsubscribes the device from the specified tag
- WLPush.isTagSubscribed(tagName) Returns whether the device is subscribed to a specified tag name.

API methods for tag and broadcast notifications

#### Client-side API

- WLNotificationListener Defines the callback method to be notified when the notification arrives. client.getPush().setWLNotificationListener(listener)
- The onMessage(props,payload) method of WLNotificationListener is called when a push notification is received by the device. \*\*\* props A JSON block that contains the notification properties of the platform. \*\*\* payload A JSON block that contains other data that is sent from MobileFirst Server. It also contains the tag name for tag-based and broadcast notification. The tag name appears in the "tag" element. For broadcast notification, the default tag name is Push.ALL.
