# Using JSONStore in Hybrid applications

#### **Overview**

This tutorial is a continuation of the JSONStore Overview tutorial. The tutorial covers the following topics:

- Add JSONStore Feature
- Basic Usage
  - Initalize
  - Get
  - Add
  - Find
  - Replace
  - Remove
  - Remove Collection
  - Destroy
- Advanced Usage
  - Security
  - Multiple User Support
  - o MobileFirst Adapter Integration
  - Enhance
- Sample application
- For more information

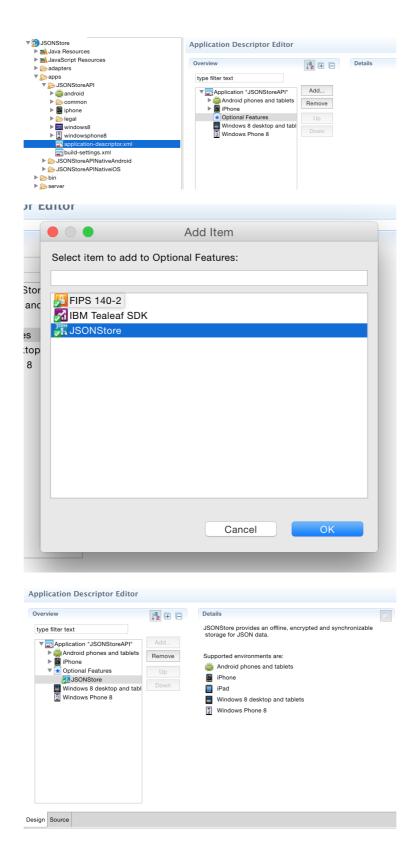

# 

### **Add JSONStore Feature**

To add JSONStore to your hybrid environment open the application-descriptor.xml simply add under the element.

```
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<application xmlns="http://www.worklight.com/application-descriptor" id="JSONStoreAPI" platformVer</p>
sion="7.0.0.00.20150312-0731">
  <displayName>JSONStoreAPI</displayName>
  <description>JSONStoreAPI</description>
  <author>
    <name>application's author</name>
    <email>application author's e-mail
    <homepage>http://mycompany.com</homepage>
    <copyright>Copyright My Company</copyright>
  </author>
  <mainFile>index.html</mainFile>
  <features>
    <JSONStore/>
  </features>
  <thumbnaillmage>common/images/thumbnail.png</thumbnaillmage>
  <iphone bundleId="com.JSONStoreAPI" version="1.0">
    <worklightSettings include="false"/>
    <security>
      <encryptWebResources enabled="false"/>
       <testWebResourcesChecksum enabled="false" ignoreFileExtensions="png, jpg, jpeg, gif, mp
4, mp3"/>
    </security>
  </iphone>
  <android version="1.0">
    <worklightSettings include="false"/>
    <security>
       <encryptWebResources enabled="false"/>
       <testWebResourcesChecksum enabled="false" ignoreFileExtensions="png, jpg, jpeg, gif, mp
4, mp3"/>
       <publicSigningKey>Replace this text with the actual public signing key of the certificate used
to sign the APK, available by using the 'Extract public signing key' wizard.</publicSigningKey>
       <packageName>Replace this text with the actual package name of the application, which is th
e value of the 'package' attribute in the 'manifest' element in AndroidManifest.xml file.</packageName>
    </security>
  </android>
  <windowsPhone8 version="1.0">
    <uuid>e5eeea5c-4c80-40d4-b250-c8f2e8698138</uuid>
  </windowsPhone8>
  <windows8 version="1.0">
    <uuid>802f8287-a3f7-4dc5-ac17-1da638074763</uuid>
  </windows8>
</application>
```

Alternatively, you can use the **Application Descriptor Editor** click **Optional Features > Add > JSONStore > OK** 

#### **Initialize**

Use init to start one or more JSONStore collections

Starting or provisioning a collections means creating the persistent storage that contains the collection and documents, if it does not exists.

If the persistent storage is encrypted and a correct password is passed, the necessary security procedures to make the data accessible are run.

For optional features that you can enable at initialization time, see **Security, Multiple User Support,** and **MobileFirst Adapter Integration** in the second part of this module

```
var collections = {
    people : {
        searchFields: {name: 'string', age: 'integer'}
    }
};

WL.JSONStore.init(collections).then(function (collections) {
    // handle success - collection.people (people's collection)
}).fail(function (error) {
        // handle failure
});
```

#### Get

Use get to create an accessor to the collection. You must call init before you call get otherwise the result of get is undefined

```
var collectionName = 'people';
var people = WL.JSONStore.get(collectionName);
```

The variable people can now be used to perform operations on the people collection such as add, find, and replace

#### Add

Use add to store data as documents inside a collection

```
var collectionName = 'people';
var options = {};
var data = {name: 'yoel', age: 23};
WL.JSONStore.get(collectionName).add(data, options).then(function () {
    // handle success
}).fail(function (error) {
    // handle failure
});
```

#### **Find**

Use find to locate a document inside a collection by using a query. Use findAll to retrieve all the documents inside a collection. Use findById to search by the document unique identifier. The default behavior for find is to do a "fuzzy" search

```
var query = {name: 'yoel'};
var collectionName = 'people';
var options = {
    exact: false, //default
    limit: 10 // returns a maximum of 10 documents, default: return every document
};

WL.JSONStore.get(collectionName).find(query, options).then(function (results) {
    // handle success - results (array of documents found)
}).fail(function (error) {
    // handle failure
});
```

## Replace

Use replace to modify documents inside a collection. The field that you use to perform the replacement is id, the document unique identifier.

```
var document = {
    __id: 1, json: {name: 'chevy', age: 23}
};
var collectionName = 'people';
var options = {};
WL.JSONStore.get(collectionName).replace(document, options).then(function (numberOfDocsReplaced) {
    // handle success
}).fail(function (error) {
    // handle failure
});
```

This examples assumes that the document  $\{ \underline{id} : 1, json : \{ name : 'yoel', age : 23 \} \}$  is in the collection

#### Remove

Use remove to delete a document from a collection

Documents are not erased from the collection until you call push. For more information, see the **MobileFirst Adapter Integration** section later in this tutorial

```
var query = {_id: 1};
var collectionName = 'people';
var options = {exact: true};
WL.JSONStore.get(collectionName).remove(query, options).then(function (numberOfDocsRemoved) {
    // handle success
}).fail(function (error) {
    // handle failure
});
```

#### **Remove Collection**

Use removeCollection to delete all the documents that are stored inside a collection. This operation is similar to dropping a table in database terms

```
var collectionName = 'people';
WL.JSONStore.get(collectionName).removeCollection().then(function (removeCollectionReturnCode) {
    // handle success
}).fail(function (error) {
    // handle failure
});
```

## **Destroy**

Use destroy to remove the following data:

- All documents
- All collections
- All Stores (see "Multiple User Support" later in this tutorial)
- All JSONStore metadata and security artifacts (see "Security" later in this tutorial)

```
var collectionName = 'people';
WL.JSONStore.destroy().then(function () {
    // handle success
}).fail(function (error) {
    // handle failure
});
```

## **Security**

You can secure all the collections in a store by passing a password to the <u>init</u> function. If no password is passed, the documents of all the collections in the store are not encrypted.

Data encryption is only available on Android, iOS, Windows Phone 8, and Windows 8 environments.

Some security metadata are stored in the keychain (iOS), shared preferences (Android), isolated storage (Windows 8 Phone), or the credential locker (Windows 8).

The store is encrypted with a 256-bit Advanced Encryption Standard (AES) key. All keys are strengthened with Password-Based Key Derivation Function 2 (PBKDF2).

Use closeAll to lock access to all the collections until you call init again. If you think of init as a login function you can think of closeAll as the corresponding logout function.

Use changePassword to change the password.

```
var collections = {
    people: {
        searchFields: {name: 'string'}
    }
};

var options = {password: '123'};
WL.JSONStore.init(collections, options).then(function () {
    // handle success
}).fail(function (error) {
    // handle failure
});
```

## **Multiple User Support**

You can create multiple stores that contain different collections in a single MobileFirst application. The init function can take an options object with a username. If no username is given, the default username is **jsonstore** 

```
var collections = {
    people: {
        searchFields: {name: 'string'}
    }
};

var options = {username: 'yoel'};
WL.JSONStore.init(collections, options).then(function () {
    // handle success
}).fail(function (error) {
    // handle failure
});
```

## **MobileFirst Adapter Integration**

This section assumes that you are familiar with MobileFirst adapters. MobileFirst Adapter Integration is optional and provides ways to send data from a collection to an adapter and get data from an adapter into a collection.

You can achieve these goals by using functions such as WL.Client.invokeProcedure or jQuery.ajax if you need more flexibility.

## Adapter Implementation

Create a MobileFirst adapter and name it "**People**". Define it's procedures addPerson, getPeople, pushPeople, removePerson, and replacePerson.

```
function getPeople() {
  var data = { peopleList : [{name: 'chevy', age: 23}, {name: 'yoel', age: 23}] }
  WL.Logger.debug('Adapter: people, procedure: getPeople called.');
  WL.Logger.debug('Sending data: ' + JSON.stringify(data));
  return data;
}
function pushPeople(data) {
  WL.Logger.debug('Adapter: people, procedure: pushPeople called.');
  WL.Logger.debug('Got data from JSONStore to ADD: ' + data);
  return;
}
function addPerson(data) {
WL.Logger.debug('Adapter: people, procedure: addPerson called.');
WL.Logger.debug('Got data from JSONStore to ADD: ' + data);
return;
}
function removePerson(data) {
WL.Logger.debug('Adapter: people, procedure: removePerson called.');
WL.Logger.debug('Got data from JSONStore to REMOVE: ' + data);
return:
function replacePerson(data) {
WL.Logger.debug('Adapter: people, procedure: replacePerson called.');
WL.Logger.debug('Got data from JSONStore to REPLACE: ' + data);
return;
}
```

Initialize a collection linked to a MobileFirst adapter

```
var collections = {
  people : {
     searchFields: {name: 'string', age: 'integer'},
     adapter: {
       name: 'People',
       add: 'addPerson',
       remove: 'removePerson',
       replace: 'replacePerson',
       load: {
          procedure: 'getPeople',
         params: [],
         key: 'peopleList'
       }
  }
}
 var options = {}; 
WL.JSONStore.init(collections, options).then(function () {
  // handle success
}).fail(function (error) {
  // handle failure
});
```

#### Load data from MobileFirst Adapter

When load is called, JSONStore uses some metadata about the adapter (**name** and **procedure**), which you previously passed to init, to determine what data to get from the adapter and eventually store it.

```
var collectionName = 'people';
WL.JSONStore.get(collectionName).load().then(function (loadedDocuments) {
    // handle success
}).fail(function (error) {
    // handle failure
});
```

## **Get Push Required (Dirty Documents)**

Calling getPushRequired returns and array of so called "dirty documents", which are documents that have local modifications that do not exist on the back-end system. These documents are sent to the MobileFirst adapter when push is called.

```
var collectionName = 'people';
WL.JSONStore.get(collectionName).getPushRequired().then(function (dirtyDocuments) {
    // handle success
}).fail(function (error) {
    // handle failure
});
```

To prevent JSONStore from marking the documents as "dirty", pass the option [markDirty:false] to add, replace, and remove

#### **Push**

push sends the documents that changed to the correct MobileFirst adapter procedure (i.e., addPerson is called with a document that was added locally). This mechanism is based on the last operation that is associated with the document that changed and the adapter metadata that is passed to init.

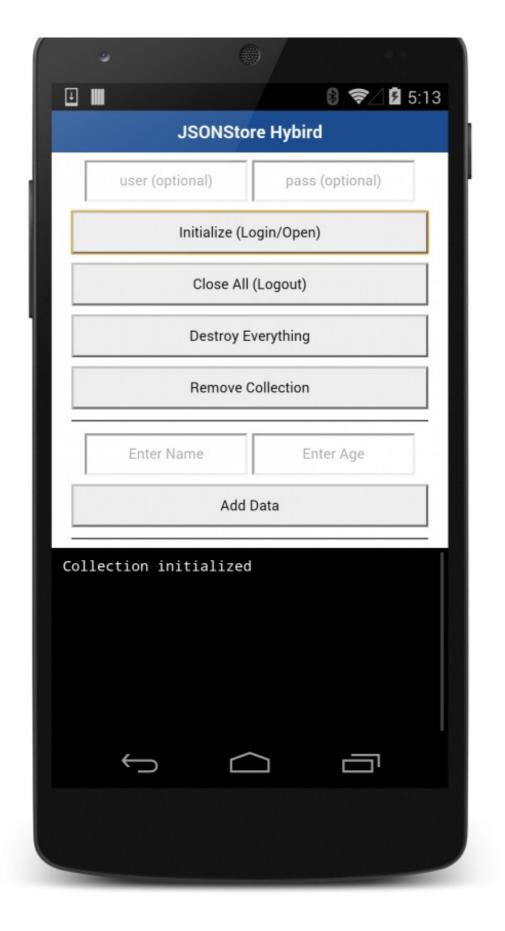

```
var collectionName = 'people';
WL.JSONStore.get(collectionName).push().then(function (response) {
    // handle success
    // response is an empty array if all documents reached the server
    // response is an array of error responses if some documents failed to reach the server
}).fail(function (error) {
    // handle failure
});
```

#### **Enhance**

Use enhance to extend the core API to fit your needs, by adding functions to a collection prototype.

This example shows how to use enhance to adde the function getValue that works on the keyvalue collection. It takes a key (string) as it's only parameter and returns a single result.

```
var collectionName = 'keyvalue';
WL.JSONStore.get(collectionName).enhance('getValue', function (key) {
  var deferred = $.Deferred();
  var collection = this;
  //Do an exact search for the key
  collection.find({key: key}, {exact:true, limit: 1}).then(deferred.resolve, deferred.reject)
  return deferred.promise();
});
//Usage:
var key = 'myKey';
WL.JSONStore.get(collectionName).getValue(key).then(function (result) {
 // handle success
 // result contains an array of documents with the results from the find
}).fail(function () {
 // handle failure
});
```

# Sample application

 ${\it Click\ to\ download\ (https://github.com/MobileFirst-Platform-Developer-Center/JSONStore/tree/release 71)}\ the\ MobileFirst\ project.$ 

The MobileFirst project contains an application that demonstrates the use of JSONStore in a hybrid environment.

## For more information

For more information about JSONStore, see the product user documentation.
