# Trusteer iOS Integration

#### ### Overview

Trusteer Mobile SDK collects multiple mobile device risk factors and provides them to the mobile app, enabling organizations to restrict mobile app functionality based on risk levels.

In your IBM MobileFirst Platform Foundation application, you may want to protect access to some specific resources or procedures based risk levels, such as detected malware or whether the device is jailbroken or rooted.

For example, you could prevent a malware-ridden device from logging into your banking app, and prevent rooted devices from using the "transfer funds" feature.

#### **Obtain Trusteer SDK for iOS**

Before starting make sure you have the following items:

- Trusteer Mobile iOS library (libtas\_full.a)
- A MobileFirst-compatible Trusteer license file (tas.license)
- A Trusteer configuration package (default\_conf.rpkg)
- A Trusteer Application Security Manifest (manifest.rpkg)

See Trusteer documentation or contact Trusteer support if you are missing any of those items. You may receive those items either as standalone files, or as an MobileFirst Application Component.

To learn more about installing an MobileFirst Application Component (\*.WLC) see MobileFirst documentation.

**Note:** You still need to follow the following steps if you use a WLC file.

#### **Copy Files Into XCode Project**

Create a directory on your system called "tas" containing the 4 above files. If you've installed Trusteer as an Application Component, this folder will be created for you in the native folder.

In your XCode project (whether MobileFirst-generated Hybrid, or your own using MobileFirst Native API), drag the folder created above onto your project navigator.

Check "Copy items into destination group's folder (if needed)".

Select "Create folder references for any added folders". Make sure your target is selected.

Drag the "tas.license" file from the tas folder into the "Resources" folder.

Make sure the file contains your license information.

The format of the file should be:

vendorld=com.mycompany clientld=my.client.id clientKey=YMAQAABNFUWS2

#### **Link Trusteer Libraries**

In **Build Phases > Link Binary With Libraries**, drag and drop **libtas\_full.a** to link your project with the Trusteer library. If you get linker errors, move **libWorklightStaticLibProject.a** to the top of the list.

In Build Settings > Linking > Other Linker Flags, add: -force\_load
"\$(SRCR00T)/tas/libtas full.a".

In Build Settings > Linking > Dead Code Stripping, select NO.

**Note:** If the iOS project is native, please follow the standard MobileFirst native requirements are described in the MobileFirst documentation as well as the requirements described in the Trusteer documentation. For example, Trusteer requires CoreMotion.framework in addition to MobileFirst's standard requirements.

#### Access Risk Items in JavaScript

Optionally, you can access the client-side generated Trusteer data object using the following API:

```
WL.Trusteer.getRiskAssessment(onSuccess, onFailure);
```

Where onSuccess is a function that will receive a JS0N object containing all the data processed by Trusteer. See Trusteer documentation to get information on each risk item.

```
function onSuccess(result) {
  //See in the logs what the full result looks like
  WL.Logger.debug(JSON.stringify(result));
  //Check for a specific flag
  if (result["os.rooted"]["value"] != 0) {
     alert("This device is jailbroken!");
  }
}
```

## **Access Risk Items in Objective-C**

Optionally, you can access the client-side generated Trusteer data object using the following API:

```
#import "WLTrusteer.h"

NSDictionary* risks =[[WLTrusteer sharedInstance] riskAssessment];<br />
```

This returns an NSDictionary of all the data processed by Truster. See Trusteer documentation to get information on each risk item.

```
//See in the logs what the full result looks like

NSLog(@"%@",risks);

//Check for a specific flag

NSNumber* rooted = [[risks objectForKey:@"os.rooted"] objectForKey:@"value"];

if([rooted intValue]!= 0){

NSLog(@"Device is jailbroken!");

}
```

## **Authentication Config**

To prevent access to specific resources when a device is at risk, you can protect your adapter procedures or your applications with a custom security test containing a Trusteer realm. See MobileFirst documentation for general information on security tests and realms.

The Trusteer realm will check the data generated by the Trusteer SDK and allow/reject the request based on the parameters you set.

Here is an example of a Trusteer realm and login module you can add to your authenticationConfig.xml.

This realm contains 5 parameters:

- rooted-device indicates whether the device is rooted (android) or jailbroken (iOS)
- device-with-malware indicates whether the device contains malware
- rooted-hiders indicate that the device contains root hiders applications that hides the fact that the device is rooted/jailbroken
- unsecured-wifi indicates that the device is currently connected to an insecure wifi.
- outdated-configuration indicates that Trusteer SDK configuration hasn't updated for some time (didn't connect to the Trusteer server).

The possible values are block, alert or accept.

## **JavaScript Challenge Handler**

Assuming you've added a Trusteer realm to your server's authentication configuration file, you can register a challenge handler to receive the responses from the authenticator.

```
var trusteerChallengeHandler = WL.Client.createWLChallengeHandler("wl_basicTrusteerFraudDetection
Realm");
```

Notice that you are registering a WLChallengeHandler and not a ChallengeHandler. See IBM MobileFirst documentation on WLChallengeHandler.

If you have set one of your realm options to block, a blocking event will trigger handleFailure.

```
trusteerChallengeHandler.handleFailure = function(error) {
    WL.SimpleDialog.show("Error", "Operation failed. Please contact customer support (reason code: " + error.reason + ")", [{text:"OK"}]);<br/>
};
```

#### error.reason can be one of the following:

- TAS ROOT
- TAS\_ROOT\_EVIDENCE
- TAS MALWARE
- TAS WIFI
- TAS OUTDATED
- TAS INVALID HEADER

• TAS NO HEADER

If your have set one of your realm options to alert, you can catch the alert event by implementing the processSuccess method.

```
trusteerChallengeHandler.processSuccess = function(identity) {
  var alerts = identity.attributes.alerts; //Array of alerts codes
  if (alerts.length > 0) {
    WL.SimpleDialog.show("Warning", "Please note that your device is: " + alerts, [{
        text: "OK "
    }]);
  }
};
```

## **Native Challenge Handler**

Assuming you've added a Trusteer realm to your server's authentication configuration file, you can register a challenge handler to receive the responses from the authenticator.

Create a class that extends WLChallengeHandler:

```
#import "WLChallengeHandler.h"
@interface TrusteerChallengeHandler : WLChallengeHandler
@end
```

Register your newly created challenge handler for your Trusteer realm:

```
[[WLClient sharedInstance] registerChallengeHandler:[[TrusteerChallengeHandler alloc] initWithReal m:@"wl_basicTrusteerFraudDetectionRealm"]];
```

If you have set one of your realm options to block, a blocking event will trigger handleFailure.

```
@implementation TrusteerChallengeHandler
//...
-(void) handleFailure: (NSDictionary *)failure {
    NSLog(@"Your request could not be completed. Reason code: %@",failure[@"reason"]);
}
//...
@end
```

error.reason can be one of the following:

- TAS ROOT
- TAS ROOT EVIDENCE
- TAS MALWARE
- TAS WIFI
- TAS OUTDATED
- TAS INVALID HEADER

• TAS NO HEADER

If your have set one of your realm options to alert, you can catch the alert event by implementing the handleSuccess method.

```
@implementation TrusteerChallengeHandler
//...
-(void) handleSuccess:(NSDictionary *)success{
    NSArray* alerts = success[@"attributes"][@"alerts"]
;
    if(alerts && alerts.count){
        for(NSString* alert in alerts){
            NSLog(@"This device is %@", alert);
        }
    }
}
//...
@end
```

## Sample application

Click to download

(http://public.dhe.ibm.com/software/products/en/MobileFirstPlatform/docs/v630/TrusteerIntegrationProject.zip) the Studio project.

Click to download

(http://public.dhe.ibm.com/software/products/en/MobileFirstPlatform/docs/v630/TrusteeriOSNativeProject.zip) the Native project.

#### Sample Setup

Download the TrusteerIntegrationProject.

Import it into your IBM MobileFirst Studio workspace.

For pure native, download and open **TrusteeriOSNativeProject** as well (update worklight.plist with your IP address).

Install the Trusteer SDK into your application(s) following the steps explained previously.

Deploy and run it on your iOS device.

The sample will display whether or not it successfully loaded the Trusteer SDK.

It will display whether your device is jailbroken or not.

It features a button to "get sensitive data", which invokes a dummy procedure protected by a Trusteer realm.

Depending on the state of your device, you should see "this is sensitive data", or an error explaining why your request was rejected.
