Java HTTP Adapter

Overview

Java adapters provide free reign over connectivity to your backend. It is therefore your responsibility to ensure best practices regarding performance and other implementation details.

This tutorial covers an example of a Java adapter that connects to an RSS feed by using a Java HttpClient.

Prerequisite: Make sure to read the Java Adapters (../) tutorial first.

RSSAdapterApplication

RSSAdapterApplication extends MFPJAXRSApplication and is a good place to trigger any initialization required by your application.

```
@Override
protected void init() throws Exception {
   RSSAdapterResource.init();
   logger.info("Adapter initialized!");
}
```

RSSAdapterResource

RSSAdapterResource is where we handle the requests to your adapter.

```
@Path("/")
public class RSSAdapterResource {
}
```

@Path("/") means that the resources will be available at the URL http(s)://host:port/ProjectName/adapters/AdapterName/.

HTTP Client

RSSAdapterResource

```
private static CloseableHttpClient client;
private static HttpHost host;

public static void init() {
    client = HttpClients.createDefault();
    host = new HttpHost("developer.ibm.com");
}
```

Because every request to your resource will create a new instance of RSSAdapterResource, it is important to reuse objects that may impact performance. In this example we made the Http client a static object and initialized it in a static init() method, which gets called by the init() of RSSAdapterApplication as described above.

Procedure resource

RSSAdapterResource

Our adapter exposes just one resource URL which allows to retrieve the RSS feed from the backend service.

- @GET means that this procedure only responds to HTTP GET requests.
- @Produces("application/json") specifies the Content Type of the response to send back. We chose to send the response as a JSON object to make it easier on the client-side.
- @Context HttpServletResponse response will be used to write to the response output stream. This enables us more granularity than returning a simple string.
- @QueryParam("tag") String tag enables the procedure to receive a parameter. The choice of QueryParam means the parameter is to be passed in the query (/RSSAdapter/? tag=MobileFirst_Platform). Other options include @PathParam, @HeaderParam, @CookieParam, @FormParam, etc.
- throws ClientProtocolException, ... means we are forwarding any exception back to the client. The client code is responsible for handling potential exceptions which will be received as HTTP 500 errors. Another solution (more likely in production code) is to handle exceptions in your server Java code and decide what to send to the client based on the exact error.
- execute(new HttpGet("/mobilefirstplatform/feed"), response). The actual HTTP request to the backend service is handled by another method defined later.

Depending if you pass a tag parameter, execute will retrieve a different build a different path and retrieve a different RSS file.

execute()

RSSAdapterResource

```
public void execute(HttpUriRequest req, HttpServletResponse resultResponse)
        throws ClientProtocolException, IOException,
        IllegalStateException, SAXException {
   HttpResponse RSSResponse = client.execute(host, req);
    ServletOutputStream os = resultResponse.getOutputStream();
    if (RSSResponse.getStatusLine().getStatusCode() == HttpStatus.SC OK){
        resultResponse.addHeader("Content-Type", "application/json");
        String json = XML.toJson(RSSResponse.getEntity().getContent());
        os.write(json.getBytes(Charset.forName("UTF-8")));
    }else{
        resultResponse.setStatus(RSSResponse.getStatusLine().getStatusCode());
        RSSResponse.getEntity().getContent().close();
        os.write(RSSResponse.getStatusLine().getReasonPhrase().getBytes());
    }
    os.flush();
   os.close();
}
```

- HttpResponse RSSResponse = client.execute(host, req). We use our static HTTP client to execute the HTTP request and store the response.
- ServletOutputStream os = resultResponse.getOutputStream(). This is the output stream to write a response to the client.
- resultResponse.addHeader("Content-Type", "application/json"). As mentioned before, we chose to send the response as JSON.
- String json = XML.toJson(RSSResponse.getEntity().getContent()). We used org.apache.wink.json4j.utils.XML to convert the XML RSS to a JSON string.
- os.write(json.getBytes(Charset.forName("UTF-8"))) the resulting JSON string is written to the output stream.

The output stream is then flushed and closed.

If RSSResponse is not 200 OK, we write the status code and reason in the response instead.

Results

The adapter should return the RSS feed converted to JSON.

">IBM MobileFirst Platform<\/a>.<\/p>",
              "encoded": "It all started when I received an email seeking
help on using MQA or to be more precise integrating MQA into Xamarin based andro
id app. Before jumping into addressing the problem, let's define MQA.<\/p
>\n<h4>What is MQA?<\/h4>\nMQA stands for &#8220;Mobile Quality Assurance&#82
21; and is part of the IBM MobileFirst Platform.<\/p>\n<blockquote><em><span
style=\"line-height: 1.5\">IBM MQA provides line of business professionals and d
evelopment teams with insightful and streamlined quality feedback and metrics f
rom both pre-production and production, enabling them to prioritize and take act
ion to support a dynamic mobile app strategy.<\/span><\/em><\/p><\/blockquote>\
n  The Features of MQA are  n < div style = \"width: 1058px \" class = \"wp-captio"
n aligncenter\"><a href=\"http:\/\/vidyasagarmsc.com\/wp-content\/uploads\/2015</pre>
\/09\/MQA1.png\"><img class=\"size-full wp-image-65\" src=\"http:\/\/vidyasagarm
sc.com\/wp-content\/uploads\/2015\/09\/MQA1.png\" alt=\"Features of Mobile Qual
ity Assurance.\" width=\"1048\" height=\"350\" \/><\/a><p class=\"wp-caption-te
xt\">Features of Mobile Quality Assurance.<\/p><\/div>\n<em><strong>Note<\/s
trong><\/em>: To understand more about MQA, visit <a href=\"http:\/\/www-03.ib
m.com\/software\/products\/en\/ibm-mobilefirst-platform-quality-assurance\">IBM
Mobile Quality Assurance<\/a><\/p>\nSo, by now we should be good with the fir
st part of our blog title that is MQA. So, the next question is<\/p>\n<h4>What i
s Xamarin.Android?<\/h4>\nXamarin is a platform to create native iOS, Andro
id, Mac and Windows apps in C#. Xamarin.Android allows us to create native Andr
oid applications using the same UI controls we would in Java, except with the fl
exibility and elegance of a modern language (C#).<\\/p>As we are good with t
he definitions, let's address the problem.<\/p>\n<strong>What&#8217;s
the problem in integrating MQA into Xamarin Android app?<\/strong><\/p>\nAt
the time of this blog post, the available MQA SDKs are iOS native SDK, Android n
ative SDK and Javascript \hat{A} SDK.<\/p>\nSo, we have to find a workaround to add
ress this use-case. The initial step is to download the Android MQA SDK and see
```

what's provided. you can download it from here<\/a>. Once successfully downloaded and u nzipped, we should see a jar file namely MQA-Android-library-<ve rsion number>.jar<\/em>Â <\/strong>under lib folder.<\/strong><\/p> \n<div style=\"width: 634px\" class=\"wp-caption aligncenter\"><a href=\"http:\</pre> /\/vidyasagarmsc.com\/wp-content\/uploads\/2015\/09\/MQA2.png\"><\/a> MQA Android SDK<\/p><\/div>\nAs Xamarin is C# b ased, What can we do with this jar file?<\/p>\nWe have Xamarin bindi ngs<\/strong> to our rescue, which helps using in consuming .JARs from C#.<\/p> \nNote<\/em>:<\/strong> Steps to consume MQA Android JAR in a Xa marin.Android app is mentioned <a href=\"https:\/\/developer.xamarin.com\/guide</pre> s\/android\/advanced topics\/java integration overview\/binding a java library $(.jar)\/\">here<\/a><\/p>\n<div style=\"width: 257px\" class=\"wp-caption align$

QA31.png\"><\/a>Xamarin binding project with MQA Andr oid .JAR file<\/p><\/div>\nThe files of our interest here are MQA-And roid-library-2.7.4.jar<\/strong> (Version number may vary) and Metadata .xml.<\/strong><\/p>\n\nMQA-Android-library-2.7.4.jar file will have al l the MQA related classes and methods required for us to start an Android MQA se ssion.<\/li>\nMetadata.xml- Allows changes to be made to the final API, such as changing the namespace of the generated binding.<\/em><\/li>\n<\/ul>\n<p >Based on the errors thrown while building the project, Metadata.xml in my case looks like this<\/p>\n<metad ata>\n <!--\n This sample removes the class: android.support.v4.content .AsyncTaskLoader.LoadTask:\n <remove-node path="\/api\/package[@name=' android.support.v4.content']\/class[@name='AsyncTaskLoader.LoadTask']" \/& gt;\n \n This sample removes the method: android.support.v4.content.CursorLoa der.loadInBackground:\n <remove-node path="\/api\/package[@name='andro id.support.v4.content']\/class[@name='CursorLoader']\/method[@name='loadInBackg name='ext.com.google.inject.spi']\/class[@name='InjectionPoint.Factory.1']" ;\/>\n <remove-node path="\/api\/package[@name='ext.com.google.inje ct.spi']\/class[@name='InjectionPoint.Factory.2']"\/>\n <remove-nod e path="\/api\/package[@name='com.applause.android.log']\/interface[@name= 'LoggerInterface']"\/>\n <remove-node path="\/api\/package[@na me='ext.com.google.inject.internal']"\/>\n <remove-node path=" \/api\/package[@name='ext.com.google.inject.matcher']"\/>\n <remove -node path="\/api\/package[@name='com.applause.android.util']\/class[@name ='AbstractRequest']"\/>\n <remove-node path="\/api\/package[@n ame='ext.com.google.inject.spi']\/class[@name='Elements.RecordingBinder']\/meth od[@name='bind' and count(parameter)=1 and parameter[1][@type='ext.com.google.in ject.Key']]"\/>\n\n<attr path="\/api\/package[@name='com.applau se.android.messages']\/class[@name='Message']\/field[@name='message']" nam e="managedName">Message1<\/attr>\n<attr path="\/api\ /package[@name='com.applause.android.log']" name="managedName"&g t;log<\/attr>\n<\/metadata>\n\n<\/pre>\nOnce all the errors are fixed and your binding project builds successfully, add a new Xamarin Android p roject (if you haven't added yet). Now, add MQA binding project reference in our Xamarin android app. Note:<\/strong><\/em> Both your binding project and Xamarin. Android project should be of same target framework. <\/strong>You can verify this by right clicking on your project -> Options -> General.<\/p>\n<div id=\"attachment 83\" style=\"width: 270px\" class=\"w p-caption aligncenter\"><a href=\"http:\/\/vidyasagarmsc.com\/wp-content\/uploa</pre> $ds\/2015\/09\/MQA5.pnq\"><imq class=\"size-full wp-image-83\" src=\"http:\/\/vid$ $yasagarmsc.com\/wp-content\/uploads\/2015\/09\/MQA5.png\"$ alt=\"Xamarin Android project with added reference to MQA\" width=\"260\" height=\"652\" \/><\/a><p cl ass=\"wp-caption-text\">Xamarin Android project with added reference to MQA<\/p ><\/div>\nNow, let’s start MQA android session in our Count.Android ap p. Sample application

Click to download (https://github.com/MobileFirst-Platform-Developer-Center/JavaAdapters) the MobileFirst project.

The attached sample includes an adapter called RSSAdapter and a hybrid application called RSSReader to test the adapter inside an application.
