## Using MobileFirst application as a container for servergenerated pages

fork and edit tutorial (https://github.com/MobileFirst-Platform-Developer-Center/DevCenter/#fork-destination-box) | report issue (https://github.com/MobileFirst-Platform-Developer-Center/DevCenter/issues/new)

### Migrating applications to IBM MobileFirst Platform Foundation

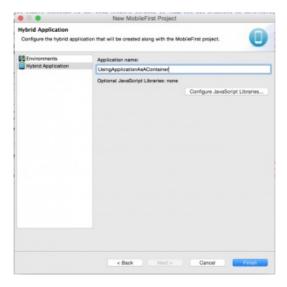

- By using mobile web technology, you can deploy applications to the widest variety of devices.
- The existence of public application stores, such as Apple iTunes and Google Play, changes the way applications are hosted and marketed. These changes make traditional methods of distribution less relevant.
- IBM MobileFirst Platform Foundation provides the solution to build cross-platform applications that can be distributed through the application stores by using the hybrid application programming model.
- In the hybrid model, developers typically package the application HTML, CSS, and JavaScript<sup>™</sup> code as part of the
  application that is deployed to the application store.
- In this module, you see the remote loading of dynamic content capability, where the HTML, CSS, and JavaScript code is hosted externally from the natively packaged hybrid.

### **Creating IBM MobileFirst applications**

A project and applications are created by using the IBM MobileFirst Project wizard.

 A project might host multiple applications. However, in this module, you use only one app: UsingApplicationAsAContainer

• Optionally the target environments can be set on the MobileFirst Project wizard or it could be done at a later time

### **IBM MobileFirst environments**

- IBM MobileFirst Foundation provides a model for organizing the application project structure for each targeted environment (for example, Android, iPhone, iPad).
- These targeted environments are selected through the MobileFirst Environment wizard.

#### **IBM MobileFirst Common environment**

- The simplest way to use IBM MobileFirst apps as containers for server generated pages is through the Common environment
- Open the application-descriptor.xml file and edit the mainFile tag to point to "http://m.ibm.com"

```
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<application xmlns="http://www.worklight.com/application-descriptor" id="UsingApplicationAsAContainer" platformVersion="6.
3.0.00.20141003-1438">
  <displayName>UsingApplicationAsAContainer</displayName>
  <description>UsingApplicationAsAContainer</description>
  <author>
    <name>application's author</name>
    <email>application author's e-mail</email>
    <homepage>http://mycompany.com</homepage>
    <copyright>Copyright My Company</copyright>
  </author>
  <mainFile>http://m.ibm.com</mainFile>
  <features/>
  <thumbnaillmage>common/images/thumbnail.png</thumbnaillmage>
  <iphone bundleId="com.UsingApplicationAsAContainer" version="1.0">
    <worklightSettings include="false"/>
    <security>
      <encryptWebResources enabled="false"/>
      <testWebResourcesChecksum enabled="false" ignoreFileExtensions="png, jpg, jpeg, gif, mp4, mp3"/>
    </security>
  </iphone>
  <android version="1.0">
    <worklightSettings include="false"/>
    <security>
      <encryptWebResources enabled="false"/>
      <testWebResourcesChecksum enabled="false" ignoreFileExtensions="png, jpg, jpeg, gif, mp4, mp3"/>
      <publicSigningKey/>
      <packageName/>
    </security>
  </android>
</application>
```

## Running your application on the Android emulator

- Build the Android environment, and then deploy the application. Right-click the generated Android project and click Run
   As > Android Application.
- You can see that http://m.ibm.com is rendered in your Android emulator.

## Running your Application on the iOS

• Deploy the application to your iOS emulator. Right-click the IOS environment, and click **Run As > Xcode project**.

# Sample application

#### Click to download

(http://public.dhe.ibm.com/software/products/en/MobileFirstPlatform/docs/v630/UsingWorklightApplicationAsAContainerProject.zip) the Studio project.
