# Custom Authentication in native Windows 8 applications

fork and edit tutorial (https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/7.1/authentication-security/custom-authentication/custom-authentication-in-native-windows-8-applications.html) | report issue (https://github.ibm.com/MFPSamples/DevCenter/issues/new)

#### **Overview**

This tutorial illustrates the native Windows 8 Universal client-side authentication components for custom authentication. Make sure you read Custom Authentication (../) first.

### Creating the client-side authentication components

Create a native Windows 8 Universal application and add the MobileFirst native APIs following the documentation.

#### CustomChallengeHandler

Create a CustomChallengeHandler class as a subclass of ChallengeHandler. CustomChallengeHandler should implement

- isCustomResponse
- handleChallenge

isCustomResponse checks every custom response received from MobileFirst Server to see if this is the challenge we are expecting.

```
public override bool isCustomResponse(WLResponse response)
{
   if (!(response.getResponseJSON()["authStatus"] == null) && response.getResponseJSON()["authStatus"].ToString().CompareTo("required") == 0)
   {
      return true;
   }
   else
   {
      return false;
   }
}
```

handleChallenge method, is called after the isCustomResponse method returned true. Within this method we present our login form. Different approaches may be adopted to present the login form.

```
public override void handleChallenge(JObject response)
{
   CoreApplication.MainView.CoreWindow.Dispatcher.RunAsync(CoreDispatcherPriority.Normal
,
   async () =>
   {
      MainPage._this.LoginGrid.Visibility = Visibility.Visible;
   });
}
```

From the login form, credentials are passed to the CustomChallengeHandler class. The submitLoginForm() method is used to send our input data to the authenticator.

```
public void sendResponse(String username, String password)
{
    Dictionary<String, String> parms = new Dictionary<String, String>();
    parms.Add("username", username);
    parms.Add("password", password);
    submitLoginForm("/my_custom_auth_request_url", parms, null, 0, "post")
;
}
```

#### MainPage

Within the MainPage class connect to MobileFirst server, register your challengeHandler and invoke the protected adapter procedure.

The procedure invocation will trigger MobileFirst server to send a challenge that will trigger our challengeHandler.

```
WLClient wlClient = WLClient.getInstance();
CustomChallengeHandler ch = new CustomChallengeHandler();
wlClient.registerChallengeHandler((BaseChallengeHandler<JObject>)ch);
MyResponseListener mylistener = new MyResponseListener(this);
wlClient.connect(mylistener);
```

Since the native API not protected by a defined security test, there is no login form presented during server connection.

Invoke the protected adapter procedure and the login form is presented by the challengeHandler.

```
WLResourceRequest adapter = new WLResourceRequest("/adapters/AuthAdapter/getSecretData", "GE T");
MyInvokeListener listener = new MyInvokeListener(this);
adapter.send(listener);
```

# **Worklight Protocol**

If your custom authenticator uses WorklightProtocolAuthenticator, some simplifications can be made:

- Subclass your challenge handler using WLChallengeHandler instead of ChallengeHandler. Note the WL.
- You no longer need to implement isCustomResponse as the challenge handler will automatically check that the realm name matches.
- handleChallenge will receive the challenge as a parameter, not the entire response object.
- Instead of submitLoginForm, use submitChallengeAnswer to send your challenge response as a JSON.
- There is no need to call submitSuccess or submitFailure as the framework will do it for you.

For an example that uses <code>WorklightProtocolAuthenticator</code>, see the Remember Me (../../.advanced-topics/remember-me/) tutorial or this video blog post (file:////home/travis/build/MFPSamples/DevCenter/\_site/blog/2015/05/29/ibm-mobilefirst-platform-foundation-custom-authenticators-and-login-modules/).

## Sample application

Click to download (https://github.com/MobileFirst-Platform-Developer-Center/CustomAuth/tree/release71) the MobileFirst project.

Click to download (https://github.com/MobileFirst-Platform-Developer-Center/CustomAuthWin8/tree/release71) the Native project.

- The CustomAuth project contains a MobileFirst native API that you can deploy to your MobileFirst server.
- The CustomAuthWin8 project contains a native Windows 8 Universal application that uses a MobileFirst native API library.
- Make sure to update the worklight.plist file in the native project with the relevant server settings.
