# Invoking adapter procedures from native Windows Phone 8 applications

#### **Overview**

To create and configure a Windows Phone 8 native project, first follow the "Creating your first Native WP8 MobileFirst application (../../hello-world/creating-first-native-windows-phone-8-mobilefirst-application/)" tutorial.

### **Initializing WLClient**

WLClient client = WLClient.getInstance();

1. To establish a connection to MobileFirst Server, use the connect method by specifying the MyConnectResponseListener class instance as a parameter.

```
{\it client.} \textbf{connect} (\textbf{new MyConnectResponseListener}(\textbf{this}));\\
```

The <u>WLClient</u> instance tries to connect to the MobileFirst Server instance according to the properties of the **wlclient.properties** file.

After the connection is established, it invokes one of the methods of the MyConnectResponseListener class.

2. Specify that the MyConnectResponseListener class implements the WLResponseListener interface.

```
public class MyConnectResponseListener : WLResponseListener
```

The WLResponseListener interface defines two methods:

- public void onSuccess (WLResponse response) { }public void onFailure (WLFailResponse response) { }
- 3. Use the previous methods to process connection success or connection failure.

# Invoking an adapter procedure

After the connection is established with a MobileFirst Server instance, you can use the WLClient instance to invoke adapter procedures.

- 1. Create a WLProcedureInvocationData object with the adapter and procedure names.
- 2. Add the required parameters as an object array and set request options (for example: Invocation Context).
- 3. Get the existing WLClient instance and use it to invoke an adapter procedure.
- 4. Specify the MyInvokeListener class instance as a parameter.

```
WLProcedureInvocationData invocationData = new WLProcedureInvocationData("RSSReader", "getStories"); invocationData.setParameters(new Object[]{}); String myContextObject = "InvokingAdapterProceduresWP8"; WLRequestOptions options = new WLRequestOptions(); options.setInvocationContext(myContextObject); WLClient.getInstance().invokeProcedure(invocationData, new MyInvokeListener(this), options);<br/>br />
```

After the procedure invocation is completed, the <u>WLClient</u> instance calls one of the methods of the <u>MyInvokeListener</u> class.

As before, you must specify that the MyInvokeListener class implements the WLResponseListener interface.

```
using IBM.Worklight;
namespace InvokingAdapterProceduresWP8{
public class MyInvokeListener : WLResponseListener
    { }
{
```

The onSuccess and onFailure methods are invoked by the WLClient. The response object contains the response data. You can use its methods and properties to retrieve the required information.

```
public void onSuccess(WLResponse response)
  WLProcedureInvocationResult invocationResponse = ((WLProcedureInvocationResult) response)
  JObject items;
  try
    items = invocationResponse.getResponseJSON();
    Deployment.Current.Dispatcher.BeginInvoke(() =>
       myMainPage.AddTextToReceivedTextBlock("Response Success: " + items.ToString());
    });
  catch (JsonReaderException e)
    Deployment.Current.Dispatcher.BeginInvoke(() =>
      myMainPage.AddTextToReceivedTextBlock("JSONException: " + e.Message);
    });
  }
}
public void onFailure(WLFailResponse response)
  Deployment.Current.Dispatcher.BeginInvoke(() =>
    myMainPage. AddTextToReceivedTextBlock("Response failed: " + response.ToString());
  });
}
```

# Sample application

The sample contains two projects:

- The **InvokingAdapterProceduresNativeProject.zip** file contains a MobileFirst Native API to deploy to MobileFirst Server.
- The **InvokingAdapterProceduresWP8project.zip** file contains a native Windows Phone 8 application that uses a MobileFirst native API library to communicate with a MobileFirst Server instance.

Make sure to update the wlclient.properties file in InvokingAdapterProceduresWP8 with the relevant server settings.
