Resource request from Cordova applications

fork and edit tutorial (https://github.ibm.com/MFPSamples/DevCenter/tree/master/tutorials/en/foundation/8.0/using-the-mfpf-sdk/resource-request-from-cordova-applications/index.md) | report issue (https://github.ibm.com/MFPSamples/DevCenter/issues/new)

Overview

MobileFirst applications can access resources using the WLResourceRequest REST API. The REST API works with all adapters and external resources.

Prerequisites:

- Ensure you have added the MobileFirst Platform SDK (../../adding-the-mfpf-sdk/cordova) to your Cordova application.
- Learn how to create adapters (../../adapters/adapters-overview/).

WLResourceRequest

The WLResourceRequest class handles resource requests to adapters or external resources.

Create a WLResourceRequest object and specify the path to the resource and the HTTP method. Available methods are: WLHttpMethodGet, WLHttpMethodPost, WLHttpMethodPut and WLHttpMethodDelete.

```
var resourceRequest = new WLResourceRequest(
   "/adapters/JavaAdapter/users",
   WLResourceRequest.GET
);
```

- For **JavaScript adapters**, use /adapters/{AdapterName}/{procedureName}
- For **Java adapters**, use /adapters/{AdapterName}/{path}. The path depends on how you defined your @Path annotations in your Java code. This would also include any @PathParam you used.
- To access resources outside of the project, use the full URL as per the requirements of the external server.
- timeout: Optional, request timeout in milliseconds

Sending the request

Request the resource by using the send() method.

The send() method takes an optional parameter to set a body to the HTTP request, which could be a JSON object or a simple string.

```
resourceRequest.send().then(
onSuccess,
onFailure
)
```

Using JavaScript **promises**, you can define onSuccess and onFailure functions.

setQueryParameter

By using the setQueryParameter method, you can include query (URL) parameters in the REST request.

• In JavaScript adapters, which use ordered nameless parameters, pass an array of parameters with the name params:

```
resourceRequest.setQueryParameter("params", "['param1', 'param2']");
```

• In Java adapters or external resources, use setQueryParameter for each parameter:

```
resourceRequest.setQueryParameter("param1", "value1");
resourceRequest.setQueryParameter("param2", "value2");
```

setHeader

By using the setHeader method, you can set a new HTTP header or replace an existing header with the same name in the REST request.

```
resourceRequest.setHeader("Header-Name","value");
```

sendFormParameters(json)

To send URL-encoded form parameters, use the sendFormParameters(json) method instead. This method converts the JSON to a URL encoded string, sets the content-type to application/x-www-form-urlencoded, and sets it as the HTTP body.

For more information about <u>WLResourceRequest</u>, see the API reference in the user documentation.

The response

Both the onSuccess and onFailure callbacks receive a response object, which typically contains the following properties:

- status: The HTTP response status
- **responseJSON**: An object that contains the data that is returned by the called resource, and additional information about the resource call.

The response object is returned to the corresponding success/failure handler.

```
"responseHeaders": {
  "Content-Type": "application/json",
  "X-Powered-By": "Servlet/3.1",
  "Content-Length": "86",
  "Date": "Mon, 15 Feb 2016 21:12:08 GMT"
 },
 "status": 200.
 "responseText": "{\"height\":\"184\",\"last\":\"Doe\",\"Date\":\"1984-12-12\",\"age\":31,\"middle\":\"C\",\"first\"
:\"John\"}",
 "responseJSON": {
  "height": "184",
  "last": "Doe",
  "Date": "1984-12-12",
  "age": 31,
  "middle": "C",
  "first": "John"
 },
 "invocationContext": null
}
```

- lerrors, info, and warnings are optional arrays of strings that contain messages.
- The isSuccessful property is set to true if the resource call succeeded (even if no data was retrieved), or to false otherwise.
- The response can contain other metadata such as responseHeaders, responseTime, statusCode, statusReason, and totalTime.

Handling the response

The response object is received by the onSuccess and onFailure callback functions. For example:

```
onSuccess: function(response) {
    resultText = "Successfully called the resource: " + response.responseText;
},
onFailure: function(response) {
    resultText = "Failed to call the resource:" + response.errorMsg;
}
```

For more information

For more information about WLResourceRequest, refer to the user documentation.

Sample application

The ResourceRequestCordova project contains a Cordova application that makes a resource request using a Java adapter.

The adapter Maven project contains the Java adapter to be used during the resource request call.

Click to download (https://github.com/MobileFirst-Platform-Developer-

Center/ResourceRequestCordova/tree/release80) the Cordova project.

Click to download (https://github.com/MobileFirst-Platform-Developer-

Center/Adapters/tree/release80) the adapter Maven project.

Sample usage

- 1. From the command line, navigate to the project's root folder.
- 2. Ensure the sample is registered in the MobileFirst Server by running the command:

mfpdev app register.

- 3. Add a platform by running the cordova platform add command.
- 4. The sample uses the JavaAdapter contained in the Adapters Maven project.

 Use either Maven or MobileFirst Developer CLI to build and deploy the adapter (../../adapters/creating-adapters/).
- 5. To test or debug an adapter, see the testing and debugging adapters (../../adapters/testing-and-debugging-adapters) tutorial.
- 6. Run the Cordova application by running the cordova run command.
