Push Notifications

Overview

Once Analytics support is set up for Push Notifications (see Setting Up Analytics Support (../../../notifications/analytics/)), you can create reports about Push usage.

Push reports

Push Notifications reports become available after Analytics support is configured, and Push events are sent to the Analytics service.

1. In the Analytics Console, choose the **Infrastructure** section from the navigation bar.
2. Choose the **Push Notifications** tab.

Two reports types are displayed:

Notification Requests
The number of requests is displayed according to the requested period, applications, and versions, broken down by date.

Notification by Mediator
The number of requests is broken down by app platform, for the requested period, applications, and versions.
