Logging in native Android (Java)

Android MobileFirst Platform SDK cannot persistently capture log data until the `com.worklight.common.Logger.setContext(Context)` method is called.

Logging example for native Android (Java):

Outputs to LogCat

```java
Copy

import com.worklight.common.Logger;

public class MathUtils{
    private static final Logger logger = Logger.getInstance(MathUtils.class.getName())
;

    public int sum(final int a, final int b){
        int sum = a + b;
        logger.debug("sum called with args " + a + " and " + b + ". Returning " + sum);

        return sum;
    }
}
```

API calls for specific tasks

Log capture is enabled by default. To turn log capture on or off:

`Logger.setCapture(false)`

The default capture level is DEBUG in development and FATAL in production. To control the capture level (verbosity):

`Logger.setLevel(Logger.LEVEL FATAL)`

Log sending is enabled by default. To turn automatic log sending on or off:

`Logger.setAutoSendLogs(false)`

> For more information about `Logger` API, see the API reference in the user documentation
