Android

The purpose of this demonstration is to make you experience an end-to-end flow where IBM MobileFirst Platform Foundation SDK for Android is integrated into an Android project and used to retrieve data by using a MobileFirst adapter.

To learn more about creating projects and applications, using adapters and lots more, visit the Native Android Development (../) landing page.

Prerequisite: Make sure that you have installed the following software:

- MobileFirst Platform command line tool (download (file:////home/travis/build/MFPSamples/DevCenter/_site/downloads))
- Android Studio

---

1. **Create a MobileFirst back-end project and adapter.**
   - Create a back-end project in a location of your choice.

     [code lang="shell"]
     mfp create MyProject
     cd MyProject
     [/code]

   - Add an HTTP adapter to the project.

     [code lang="shell"]
     mfp add adapter MyAdapter -t http
     [/code]

2. **Deploy artifacts to the MobileFirst Server.**
   - Start the MobileFirst Server and deploy the adapter.

     [code lang="shell"]
     mfp start
     mfp push
     [/code]

3. **Create an Android project in Android Studio.**

4. **Add the MobileFirst Android SDK to the Android Studio project**
   - In **Project > Gradle scripts**, select **build.gradle (Module: app)**.
   - After `apply plugin: 'com.android.application'`, add the following line:
     [code lang="xml"]repositories{

- jcenter()

  }[/code]

- Inside `android`, add the following lines:

  [code lang="xml"]packagingOptions {

  pickFirst 'META-INF/ASL2.0'

  pickFirst 'META-INF/LICENSE'

  pickFirst 'META-INF/NOTICE'

  }[/code]

- Inside `dependencies`, add the following lines:

  [code lang="xml"]compile group: 'com.ibm.mobile.foundation',

  name: 'ibmmobilefirstplatformfoundation',

  version: '7.1.0.0',

  ext: 'aar',

  transitive: true[/code]

- Add the following permissions to the `AndroidManifest.xml` file:

  [code lang="xml"]

  <uses-permission android:name="android.permission.INTERNET"/>

  <uses-permission android:name="android.permission.ACCESS_WIFI_STATE"/>

  <uses-permission android:name="android.permission.GET_TASKS" />

  [/code]

- Add the MobileFirst UI activity:

  [code lang="xml"]<activity android:name="com.worklight.wlclient.ui.UIActivity" />[/code]

- In Terminal, navigate to the root of the Android Studio project and add the required configuration files by running this command:

  [code lang="xml"]

  mfp push[/code]

Implement MobileFirst adapter invocation.

Main `Activity` class

Make sure that your MainActivity class extends the `Activity` class:

[code lang="java"]

public class MainActivity extends Activity {

...

[/code]

Add the following `import` statements:

[code lang="java"]import com.worklight.wlclient.api.*;

import android.util.Log;

import java.net.URI;

import java.net.URISyntaxException;[/code]

Add the following lines to the `onCreate` method:

[code lang="java"]

super.onCreate(savedInstanceState);

```java
setContentView(R.layout.activity_main);

final WLClient client = WLClient.createInstance(this);

client.connect(new WLResponseListener() {

@Override
public void onSuccess(WLResponse wlResponse) {
URI adapterPath = null;
try {
adapterPath = new URI("/adapters/MyAdapter/getFeed");
} catch (URISyntaxException e) {
e.printStackTrace();
}
WLResourceRequest request = new
WLResourceRequest(adapterPath,WLResourceRequest.GET);
request.send(new MyInvokeListener());
}

@Override
public void onFailure(WLFailResponse wlFailResponse) {
Log.i("MFPMyProject","Failed connecting to the MobileFirst Server: " +
wlFailResponse.getErrorMsg());
}
});
```

- ## MyInvokeListener class

  Add a new `MyInvokeListener` class.
  Add the following `import` statements:
  ```java
  import com.worklight.wlclient.api.*;
  import android.util.Log;
  ```

  Paste the following lines:
  ```java
  public class MyInvokeListener implements WLResponseListener {

  @Override
  public void onSuccess(WLResponse wlResponse) {
  Log.i("MFPMyProject","Adapter invocation response: " +
  wlResponse.getResponseJSON());
  }

  @Override
  public void onFailure(WLFailResponse wlFailResponse) {
  Log.i("MFPMyProject", "Adapter invocation response: " +
  wlFailResponse.getErrorMsg());
  }
  }
  ```

◦ Final configurations

- Create an Android Virtual Device (AVD).

◦ Click Run.

Review the LogCat view for the data retrieved by the adapter request.
